

B23C

MILLING (broaching [B23D](#); broach-milling in making gears [B23F](#); arrangement for copying or controlling [B23Q](#))

Definition statement

This place covers:

Milling machines, milling tools, milling methods and milling devices able to be attached to a machine tool other than a milling machine for milling metal and metal-like workpieces.

Milling should be interpreted as the removal of material in the form of chips from a workpiece by a rotating tool with a geometrically defined cutting edge wherein the main cutting force is generated as a result of the rotation of the tool in order to produce a shaped surface on the workpiece.

Relationships with other classification places

Cutting inserts, which are suitable for both milling and turning or for which no particular application is given are classified in [B23B 27/14](#).

Milling of threads and tools for milling threads are classified in [B23G](#).

Milling of gears is classified in [B23F](#). Some gear milling tools may be classified in [B23C](#) as well if the disclosure is relevant for the general field of milling.

There is overlap with the circular sawing field ([B23D 61/02](#)) as some tools can be used as either milling cutters or saws.

Special rules of classification

The use of Indexing Codes within the series [B23C](#) is widespread in the subclass. Indexing Codes should be allocated at every opportunity. When classifying milling cutters and milling inserts particular attention should be paid to the Indexing Codes. Indexing Codes should also be added routinely to give details of the workpiece or tool configuration, when this is not implicit in the classification system. For example a document showing a particular tool using machining of a crankshaft may be given a class for inventive information only for the details of the milling cutter. Such a document should also be allocated Indexing Codes relating to the workpiece type, the method of milling and/or further details of the milling cutter itself to allow easy retrieval.

The number of 200 series Indexing Codes is too high to list individually. Where the allocation of Indexing Code is compulsory, this is indicated in the templates for the main-group at the sub-group level.

- An set of drawings is provided under the definition statement for each main group. These drawings illustrate by example the content of the most widely used groups in this sub-class. Each of the drawings is taken from a document within from the group.

B23C 1/00

Milling machines not designed for particular work or special operations

Definition statement

This place covers:

machines designed primarily for milling metallic materials.

[B23C 1/002](#)

Gantry milling device (note also [B23Q 1/012](#) portal machines)

[B23C 1/027](#)

Milling machine with adjustable working spindle

[B23C 1/06](#)

vertical milling machine

Relationships with other classification places

This group does not cover multi-purpose machines (e.g. jig borers, horizontal borers etc) that can perform drilling, milling and other operations. These types of machine are classified in [B23Q](#) with details of their constructional details.

Special rules of classification

Classification is generally per literal interpretation of the group and sub-group headings.

Further details of subgroups

Subgroup [B23C 1/14](#) is not used. Refer to [B23Q 1/00](#)

Subgroups [B23C 1/16](#) and [B23C 1/18](#) are not used. Refer to [B23Q 35/00](#)

[B23C 1/20](#) refers to portable milling devices. Note routers (which may be translated from German as "milling machines") are classed in [B27C 5/10](#).

B23C 3/00

Milling particular work; Special milling operations; Machines therefor (milling gear-teeth [B23F](#), {heat assisted machining [B23P 25/00](#)})

Definition statement

This place covers:

Milling particular work.

[B23C 3/005](#)

Rail milling device

[B23C 3/023](#)

Milling spherical surfaces

[B23C 3/055](#)

Engine valve seat milling tool

[B23C 3/056](#)

Seat milling tool for valve seat in a valve

[B23C 3/06](#)

Milling crankshafts

fig.1
PRIOR ART

[B23C 3/12](#)

Finishing or trimming edges includes deburring by milling

[B23C 3/124](#)

Milling edges off inside of pipe

[B23C 3/126](#)

Portable device for chamfering edges

[B23C 3/18](#) (and [B23C 2215/44](#))

Milling turbine blades

[B23C 3/20](#)

Milling dies

[B23C 3/28](#) (and [B23C 2220/366](#))

Milling grooves for turbine blades

[B23C 3/30](#)

Milling straight grooves in CV joint hub (7)

[B23C 3/32](#)

Definition statement

Milling helical grooves in cable drum.

Note [B23G 1/32](#) threading by milling.

[B23C 3/35](#)

Milling of keys

References

Limiting references

This place does not cover:

The production of items by the use of milling techniques which are known per se.	B23P
--	----------------------

Special rules of classification

Classification is generally per literal interpretation of the group and subgroup headings. The following should be noted:

Further details of subgroups

- [B23C 3/00](#): Miscellaneous milling operations for operations not provided in subgroups but where the milling process per se is relevant.
- [B23C 3/02](#): Milling surfaces of revolution including orbital drilling. For orbital drilling, also allocate the Indexing Code [B23C 2220/52](#).
- [B23C 3/05](#): Milling valve seats, includes boring units.
- [B23C 3/06](#), [B23C 3/08](#): Milling crankshafts or camshafts. See also [B23B 5/18](#) (turning) and [B23D 37/005](#) (broaching).
- [B23C 3/10](#): Milling of relief surfaces, including the milling of relief surfaces on tools
- [B23C 3/12](#): Trimming edges (deburring by milling). Note deburring by grinding is classified in [B24](#), deburring by scraping in [B23D 79/00](#), deburring by chamfering drilled hole in [B23B 51/10](#).
- [B23C 3/16](#) Within this subgroup the terms "scrubbing" and "peeling" are synonyms for "milling". The important qualifier in this subgroup is the ingot (or similar workpiece).
- [B23C 3/18](#): Milling curved surfaces of turbine blades etc. Note production of turbine blades [B23P 15/02](#) and [B23P 15/04](#).
- [B23C 3/28](#): Milling grooves, including retaining grooves in turbine blades etc.
- [B23C 3/35](#): Milling keys. Keys in this groups are the devices that fit in locks, not devices to prevent rotation between two objects. Optical recognition systems [G06K](#). Keys per se [E05B 19/00](#). Note the particular Indexing Codes [B23C 2235/00](#) - [B23C 2235/48](#).

[B23C 3/355](#) should be interpreted as holders for both the master key and the key forming the workpiece being cut.

[B23C 3/36](#) milling of milling cutters. Note that making of milling cutters by multi-stage processes (whether or not including milling) is classed in [B23P 15/34](#). [B23C 3/36](#) relates to the details of the process of milling milling cutters wherein the milling in itself is of interest.

B23C 5/00

Milling-cutters (for cutting gear-teeth [B23F 21/12](#))

Special rules of classification

Classification is generally per literal interpretation of the group and subgroup headings.

Allocation of Indexing Codes from the section "Details of milling cutters" [B23C 2210/00](#) is mandatory in [B23C 5/00](#).

B23C 5/04

Plain cutters, i.e. having essentially a cylindrical or tapered cutting surface of substantial length ([B23C 5/10](#) takes precedence)

Definition statement

This place covers:

Plain cutters having a generally long (in relation to diameter) circumferential cutting surface. Generally no cutting on end surfaces.

Plain milling cutter:

References

Limiting references

This place does not cover:

Shank-type cutters, i.e. with an integral shaft	B23C 5/10
---	---------------------------

B23C 5/06

Face-milling cutters, i.e. having only or primarily a substantially flat cutting surface

Definition statement

This place covers:

Face-milling cutters used for producing flat surfaces that are at right angles to the axis of rotation of the cutter. Generally, the cutters cut a limited depth on the circumferential surface of the tool.

B23C 5/08

Disc-type cutters

Definition statement

This place covers:

Cutters having a cutter body with the general configuration of a disc, i.e. a thin, flat, round shape, for cutting grooves or slots into the workpiece. Also known as side cutter or side-and-face cutter.

Relationships with other classification places

When the cutter divides or cuts a metal workpiece into two pieces, the cutter is considered a sawing tool and should be classified in [B23D 45/00](#).

Special rules of classification

Milling cutters used in whirling processes should receive a classification in [B23C 2220/68](#).

Plate-like cutting inserts fitted on a ring or ring segment attached to a separate, main tool body should be classified in the following: [B23C 5/2234](#), [B23C 5/226](#), [B23C 5/2291](#) or [B23C 5/2309](#).

B23C 5/10

Shank-type cutters, i.e. with an integral shaft

Definition statement

This place covers:

An end mill (also called a slot drill) having a generally cylindrical shank with a cutting portion extending from the shank. The cutting portion is capable of cutting in the axial and radial directions by cutting edges on the circumferential and end surfaces of the cutting portion.

Milling cutter (slot drill) with shank having end cutters extending to cutter axis to enable axial feed:

Milling cutter with head detachable from shaft:

Fig 2

Milling cutter with shaft for roughing:

Relationships with other classification places

Note that milling cutters with shafts that include inventive features related to the securing or placement in the chuck are classified in [B23B 31/005](#) or [B23B 31/006](#), accompanied by Indexing Codes from [B23B 2231/02](#) and subgroups.

Special rules of classification

Note that milling cutters with detachable heads are placed here with the allocation of Indexing codes [B23C 2210/02](#) and/or [B23C 2210/03](#) as appropriate. A detachable head is generally seen as being something attached to the end of the shank that covers the whole of the cross section of the shank.

B23C 5/1036

{having a single cutting insert, the cutting edges of which subtend 180 degrees}

Definition statement

This place covers:

Ball nosed milling cutter with removable insert.

B23C 5/1054**{T slot cutters}****Definition statement***This place covers:*

A slot cutter that produces a finished slot in the shape of the letter "T" (also includes inverted letter "T").

**B23C 5/1081**

{with permanently fixed cutting inserts ([B23C 5/1018](#) and [B23C 5/1063](#) take precedence)}

Definition statement*This place covers:*

Milling cutter with shaft and permanently attached inserts, e.g. via welding or brazing:

References

Limiting references

This place does not cover:

Ball nose end mills with permanently fixed cutting inserts	B23C 5/1018
T slot cutters with permanently fixed cutting inserts	B23C 5/1063

Special rules of classification

Note that milling cutters with permanently attached inserts made of PCD or CBN are placed here with the allocation of Indexing codes [B23C 2226/315](#) for PCD or [B23C 2226/125](#) for CBN.

B23C 5/109

{with removable cutting inserts}

Definition statement

This place covers:

Milling cutter with shaft and removable inserts.

Special rules of classification

Note that milling cutters with detachable heads are not classed in [B23C 5/109](#) but in [B23C 5/10](#) with the allocation of Indexing Codes [B23C 2210/02](#) and/or [B23C 2210/03](#) as appropriate. A detachable head is generally seen as being something attached to the end of the shank that covers the whole of the cross section of the shank.

B23C 5/12

Cutters specially designed for producing particular profiles ([B23C 5/10](#) takes precedence)

Definition statement

This place covers:

Cutters for producing a particular profile, i.e. cutting edge shape has a direct correlation to the finished shape of the workpiece.

References

Limiting references

This place does not cover:

Shank-type cutters, i.e. with an integral shaft	B23C 5/10
---	---------------------------

Special rules of classification

Indexing Codes for chamfering ([B23C 2220/16](#)) and turbine blade grooves ([B23C 2220/366](#)) should be considered if those profiles are present.

B23C 5/18

with permanently-fixed cutter-bits or teeth

Definition statement

This place covers:

Milling cutter with permanently fixed inserts.

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Shank-type cutters with permanently fixed cutting inserts	B23C 5/1081
---	-----------------------------

B23C 5/20

with removable cutter bits or teeth {or cutting inserts}

Definition statement

This place covers:

Removable cutting inserts that are generic, i.e. no special shape or special features.

Special rules of classification

Documents classified in [B23C 5/20](#), [B23C 5/22](#) and [B23C 5/24](#) should also receive Indexing Codes from group [B23C 2200/00](#) entitled "Details of milling inserts" when applicable. Indexing Codes should be allocated only for special features of the insert.

For example, if the insert has a fixation hole of a special shape, the appropriate Indexing Code ([B23C 2200/361](#)) should be given. This Indexing Code should not, however, be given to every insert having a fixation hole.

An Indexing Code from the group [B23C 2200/00](#) entitled "Details of cutting inserts" takes precedence over an Indexing Code from other groups.

For example, an insert with a curved cutting edge should be allocated the Indexing Code [B23C 2200/203](#). The allocation of [B23C 2210/084](#) is not necessary or desired.

B23C 5/202

{Plate-like cutting inserts with special form (special form related to securing of the insert [B23C 5/22](#))}

Definition statement

This place covers:

Removable cutting inserts having a special shape. The shape may be considered special by virtue of, inter alia, the overall shape and cutting edge configuration.

Examples:

Tangentially mounted milling insert:

Milling insert with curved cutting edge and wiper:

Milling insert with interrupted cutting edge and chip-breaking projections on the top surface:

Milling insert with sloped cutting edges (6a-d) and rake faces (10) above a central surface (9):

Relationships with other classification places

[B23B 27/141](#), [B23B 27/143](#) and [B23B 27/145](#) are the equivalent subgroups for turning or general-purpose inserts. If the insert can be used for turning and milling only a class in [B23B 27/141](#), [B23B 27/143](#) or [B23B 27/145](#) is given.

Relationships with other classification places

Inserts in this subgroup are not classed for composition of inserts ([C22C](#) or [C04B](#)) or merely for the composition of the coating (see [C23C](#)). However inserts where the coating is selectively applied to areas of the insert or having a particular material and a special shape will be classed here.

References

Limiting references

This place does not cover:

Cutting insert having special form related to the securing arrangement within the holder	B23C 5/22
--	---------------------------

Special rules of classification

Note that end mills with detachable heads are not classified as end mills with cutting inserts in [B23C 5/202](#), but in [B23C 5/10](#) with the Indexing Codes [B23C 2210/02](#) or [B23C 2210/03](#) as appropriate.

Inserts having a special shape by virtue only of the chip-breakers are classed in [B23C 5/205](#).

Cutting inserts having a special shape related to securing the cutting inserts, e.g. locating or clamping the insert within the holder, should be classified in [B23C 5/22](#) or subgroups [B23C 5/2204](#), [B23C 5/2208](#), [B23C 5/2239](#), [B23C 5/2243](#), [B23C 5/2265](#), [B23C 5/2269](#), [B23C 5/2295](#), [B23C 5/2298](#) or [B23C 5/2301](#) according to the clamping mechanism.

Cutting inserts having a special shape that is not related to securing or locating the cutting insert within the tool body and a special shape that is related to securing or locating the cutting insert within the tool body should be classified in [B23C 5/202](#) (or subgroup [B23C 5/205](#)) and [B23C 5/22](#) (or subgroups).

B23C 5/205

{characterised by chip-breakers of special form}

Definition statement

This place covers:

Inserts having a special shape by virtue only of the chip-breakers.

Examples:

B23C 5/22

Securing arrangements for bits or teeth {or cutting inserts}

Definition statement

This place covers:

Special arrangements of how the cutting inserts are fastened to the cutter body.

Special rules of classification

Cutting inserts having a special shape that is not related to securing or locating the cutting insert within the tool body and a special shape that is related to securing or locating the cutting insert within the tool body should be classified in [B23C 5/202](#) (or subgroup [B23C 5/205](#)) and one of the following subgroups according to the clamping mechanism: [B23C 5/2213](#), [B23C 5/2247](#), [B23C 5/2273](#) or [B23C 5/2304](#).

Documents classified in [B23C 5/20](#), [B23C 5/22](#) and [B23C 5/24](#) should also receive Indexing Codes from group [B23C 2200/00](#) entitled "Details of milling inserts" when applicable. Indexing Codes should be allocated only for special features of the insert. For example, if the insert has a fixation hole of a special shape, the appropriate Indexing Code ([B23C 2200/361](#)) should be given. This Indexing Code should not, however, be given to every insert having a fixation hole.

An Indexing Code from the group [B23C 2200/00](#) entitled "Details of cutting inserts" takes precedence over an Indexing Code from other groups. For example, an insert with a curved cutting edge should be allocated the Indexing Code [B23C 2200/203](#). The allocation of [B23C 2210/084](#) is not necessary or desired.

B23C 5/2208

{for plate-like cutting inserts ([B23C 5/2226](#), [B23C 5/2234](#) take precedence)}

Definition statement

This place covers:

Plate-like cutting inserts clamped against walls of the recess in the shank by a clamping member acting upon the wall of a hole in the insert.

References

Limiting references

This place does not cover:

For plate-like cutting inserts fitted on an intermediate carrier, e.g. shank fixed in the cutter body	B23C 5/2226
For plate-like cutting inserts fitted on a ring or ring segment	B23C 5/2234

B23C 5/2213

{having a special shape}

Definition statement

This place covers:

Plate-like cutting inserts of special shape where clamping against the walls of a pocket by means of something acting on the hole in the insert is also important. The shape may be considered special by virtue of, inter alia, the overall shape and cutting edge configuration.

Example:

Insert has a special shape due to the fixation hole being widened at the bottom to permit the inclined orientation of the fastener and the fastener interacts with the sidewall of the hole in the insert.

B23C 5/2226

{for plate-like cutting inserts fitted on an intermediate carrier, e.g. shank fixed in the cutter body}

Definition statement

This place covers:

Plate-like cutting insert clamped against walls of the recess in an intermediate carrier of the cutter body by a clamping member acting upon the wall of a hole in the insert.

Example:

Intermediate carrier (10) with insert (11)

Example:

Intermediate carrier (A) formed as a shank for insert (B)

B23C 5/2234

{for plate-like cutting inserts fitted on a ring or ring segment}

Definition statement

This place covers:

Plate-like cutting inserts clamped against walls of the recess in a shank (16) by a clamping member (14) acting upon the wall of a hole in the insert, and fitted on a ring (10):

B23C 5/2239

{with cutting inserts clamped by a clamping member acting almost perpendicular on the cutting face}

Definition statement

This place covers:

Plate-like cutting inserts clamped by clamping member (32) acting almost perpendicular on the cutting face:

**B23C 5/2243**

{for plate-like cutting inserts ([B23C 5/2252](#), [B23C 5/226](#) take precedence)}

Definition statement

This place covers:

Plate-like cutting inserts (3) clamped by a clamping member (4) acting almost perpendicular on the cutting face:

B23C 5/2291

{for plate-like cutting inserts fitted on a ring or ring segment}

Definition statement

This place covers:

Example:

Plate-like cutting insert (27) fitted on a ring segment (45) and secured by a wedge (77).

B23C 5/2295

{the cutting elements being clamped simultaneously}

Definition statement

This place covers:

Simultaneous clamping of all cutting inserts.

B23C 5/2309

{for plate-like cutting inserts fitted on a ring or ring segment}

Definition statement

This place covers:

Example:

Plate-like cutting insert (5, 51) fitted on a ring segment (13) and secured by resilient/flexible means (3, 4).

**B23C 5/24**

adjustable

Definition statement

This place covers:

Features relative to the adjustment of the insert relative to the cutter body.

Special rules of classification

Documents classified in [B23C 5/20](#), [B23C 5/22](#) and [B23C 5/24](#) should also receive Indexing Codes from group [B23C 2200/00](#) entitled "Details of milling inserts" when applicable. Indexing Codes should be allocated only for special features of the insert.

For example, if the insert has a fixation hole of a special shape, the appropriate Indexing Code ([B23C 2200/361](#)) should be given. This Indexing Code should not, however, be given to every insert having a fixation hole.

An Indexing Code from the group [B23C 2200/00](#) entitled "Details of cutting inserts" takes precedence over an Indexing Code from other groups.

For example, an insert with a curved cutting edge should be allocated the Indexing Code [B23C 2200/203](#). The allocation of [B23C 2210/084](#) is not necessary or desired.

B23C 5/2462

{the adjusting means being oblique surfaces}

Definition statement

This place covers:

Adjustment of insert position by oblique surfaces.

B23C 5/2465

{the adjusting means being notches}

Definition statement

This place covers:

Adjustment of position of insert by notches.

B23C 5/2468

{the adjusting means being serrations}

Definition statement

This place covers:

Adjustment of insert position by means of serrations

B23C 5/2472**{the adjusting means being screws}****Definition statement***This place covers:*

Adjustment of insert position by means of screws.

**B23C 5/2475****{the adjusting means being distance elements, e.g. shims or washers}****Definition statement***This place covers:*

Adjustment of insert position by means of spacers.

B23C 5/2479

{the adjusting means being eccentrics}

Definition statement

This place covers:

Adjustment of insert position by means of rotating an eccentric, i.e. an object that is not perfectly circular.

B23C 5/2482

{the adjusting means being hydraulic cylinders}

Definition statement

This place covers:

Adjustment of insert position by means of hydraulics.

B23C 5/2486

{where the adjustment is made by elastically deforming the toolholders}

Definition statement

This place covers:

Adjustment by means of elastically deforming the tool carrier.

**B23C 5/26**

Securing milling cutters to the driving spindle

Definition statement

This place covers:

Details of arrangements for securing cutters to the spindle, including details of intermediate connecting members, e.g. arbors.

**References****Informative references**

Arrangements for cooling or lubricating tools or work, in general	B23Q 11/10
---	----------------------------

Special rules of classification

Note also the Indexing Code relating to cooling ([B23C 2250/12](#)) for non-invention information.

B23C 5/281

{Coolant moving along the outside tool periphery towards the cutting edges}

Definition statement

This place covers:

Milling cutters with means for coolant to move along the outside of the tool periphery toward cutting edges. This area is not meant for coolant outlets that exit from an interior channel into the chip flutes that then guide the coolant toward the cutting edges.

B23C 5/282**{Coolant channel characterised by its cross-sectional shape}****Definition statement***This place covers:*

Special details of the coolant channel(s) cross-sectional shape (cross-section not required to be perpendicular to rotation axis of cutter body). The term "special" means non-generic details of the cross-sectional shape, e.g. mere cross-sections of a single circular nature would be excluded from this sub-class.

**B23C 5/283****{Cutting inserts with internal coolant channels}****Definition statement***This place covers:*

Cutting inserts with interior coolant channels.

Example:

Example:

B23C 5/285**{Nozzles}****Definition statement**

This place covers:

Nozzles to point or direct the coolant in a desired direction.

B23C 5/286**{Deflectors}****Definition statement**

This place covers:

Deflector to point or direct the coolant in a desired direction.

**B23C 5/287****{intersecting the rotational axis}****Definition statement**

This place covers:

Deflector intersects the rotational axis of the cutter body such that coolant is deflected at the rotational axis.

Example:

Example:

B23C 7/00

Milling devices able to be attached to a machine tool, whether or not replacing an operative portion of the machine tool

Definition statement

This place covers:

Milling devices able to be attached to a machine tool

[B23C 7/02](#)

Device attached to a lathe to allow milling

Special rules of classification

Classification is per literal interpretation of the group and subgroup headings. The term "machine tool" should be interpreted as a machine tool not normally capable of performing milling. Devices for attachment into the spindle (speed changers, angled heads, offset heads) are classified in [B23Q 5/04](#). The term "device" should be interpreted as a discrete device, so lathes with provision for performing milling as a result of integrated features will not be classed here.

B23C 9/00

Details or accessories so far as specially adapted to milling machines or cutter (drives, control devices, or accessories, in general [B23Q](#))

Definition statement

This place covers:

Details or accessories so far as specially adapted to milling machines or cutters

[B23C 9/005](#)

Milling head.

Special rules of classification

Classification is generally per literal interpretation of the group and subgroup headings.

The term "specially adapted to milling machines" should be interpreted narrowly as adapted to machines specifically designed for performing milling operations. Details of machines performing milling and other operations should be classified in [B23Q](#). This group includes milling templates. Obviously with the move towards multi-function machine tools, this group has become less well-used.

Details or accessories of machine tools in general & copying devices are classified in [B23Q](#).

[B23C 9/005](#) Milling heads may mean details of the heads of milling machines including the main spindle of a machine tool or a head able to be attached to a machine tool for the specific purpose of milling. Machining heads used on gantry machines with multiple axes or movement are classified in the relevant subgroup of [B23Q 1/25](#). Machining heads characterised by the mechanisms for driving the spindle or for providing feeding motion are classified in [B23Q 5/00](#). Detachable heads including speed changers, offset drives or right angled drives for general work are classed in [B23Q 5/04](#).
