

H02M

APPARATUS FOR CONVERSION BETWEEN AC AND AC, BETWEEN AC AND DC, OR BETWEEN DC AND DC, AND FOR USE WITH MAINS OR SIMILAR POWER SUPPLY SYSTEMS; CONVERSION OF DC OR AC INPUT POWER INTO SURGE OUTPUT POWER; CONTROL OR REGULATION THEREOF (transformers [H01F](#); dynamo-electric converters [H02K 47/00](#); controlling transformers, reactors or choke coils, control or regulation of electric motors, generators or dynamo-electric converters [H02P](#))

Definition statement

This place covers:

Only circuits or apparatus for the conversion of AC or DC input power into AC or DC output power, or the conversion of AC or DC input power into surge output power, or arrangements for control or regulation of such circuits or apparatus.

Relationships with other classification places

The individual electro-technical devices employed when converting electric power are covered by the relevant subclasses, e.g. inductors, transformers [H01F](#), capacitors, electrolytic rectifiers [H01G](#), mercury-vapour rectifying or other discharge tubes [H01J](#), semiconductor devices [H01L](#), [H10](#) impedance networks or resonant circuits not primarily concerned with the transfer of electric power [H03H](#).

Voltage and current regulation circuits operating according to the non-switched (linear) principle are classified in subclass [G05F](#)

The subject matter of starting, regulating, electronically commutating, braking, or otherwise controlling electrical machines using power converters covered by this subclass is classified in subclass [H02P](#).

Arrangements of power converters of this subclass in power distribution networks, not being concerned with the particular converter designs, are classified in subclass [H02J](#).

Measuring of circuit parameters such as currents, voltages or magnetic flux in general and not particularly intended for power converters of this subclass, is classified in subclass [G01R](#).

General mechanical arrangements of electronic components other than mechanical arrangements particularly intended for power converters of this subclass, are classified in subclass [H05K](#).

Protection circuits in general, other than those forming an integral part of power converters of this subclass are classified in subclass [H02H](#)

Enabling and disabling of power switches, other than particularly intended for power switches in power converters of this subclass, is classified in subclass [H03K](#).

Use and generation of Pulse Width Modulation schemes, other than particularly intended for power converters of this subclass, are classified in subclass [H03K](#)

General testing and monitoring of power converters of this subclass are classified in subclass [G01R](#)

Power converters particularly adapted for charging batteries are classified in subclass [H02J](#).

Uninterruptible Power Supplies are classified in subclass [H02J](#)

Dynamically controlled power converters, that serve the purpose of signal amplification rather than energy supply as in this subclass, are classified in [H03F](#)

Relationships with other classification places

Power supply circuits particularly intended for operating light sources are classified in subclass [H05B](#)

Power supply circuits and arrangements particularly intended for computer type gear are classified in subclass [G06F](#)

Power supply circuits and arrangements particularly intended for video type gear are classified in subclass [H04N](#)

Switched capacitor power conversion circuits particularly intended for supply of semiconductor memory circuits are classified in subclass [G11C](#)

Generation of pulsed high-voltages used to generate sparks is classified in [H01T/F23Q/F02P](#)

Power converters being used in a particular application and characterised by their operation in that application, without focus on the design of power converter, are classified in the subclass relevant for the application.

Pulse generators	H03K
Electronic switching or gating	H03K 17/00
Generation or supply of power specially adapted for television receivers	H04N 5/63

Special rules of classification

Switch Mode Power Converters are generally made up of generic, functional elements. Such generic elements are rectifiers (AC-DC-conversion), inverters (DC-AC-conversion), transformers (AC-AC-conversion), filters, regulation loops, resonance-circuits, drivers, snubbers etc. Of these generic elements only few may appear at first glance to be novel over the prior art and it serves no purpose repeatedly to classify all elements. Only those elements that appear novel should form basis for the classification.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

SMPS	Switch Mode Power Supply. A general designation for the type of power converters where power is converted in small quantities at a very rapid pace. The energy entering into the conversion circuit or out of the conversion circuit is controlled by power switches. In an SMPS the power switches are typically operated either to be fully conducting or fully non-conducting, opposite to linear voltage regulators where the power switch is used as partly conductive.
Chopper	Chopper is another name for a switch mode circuit. Chopper refers to that the signal (energy flow) is cut-up into small amounts.
Conversion	In respect of an electric variable, e.g. voltage or current, conversion means the change of one or more of the parameters of the variable, e.g. amplitude, frequency, phase, polarity.
PFC	Power Factor Correction. PFC relates to AC power input. Power Factor Correction is the discipline of rendering the input current sine-wave-shaped, with little harmonics and in phase with the AC input voltage. The aim is to make the AC input power load appear purely resistive for efficient use of the AC distribution network.
Snubber	A circuit aiming at absorbing or redirecting inductive energy generated during switched power conversion when a power switch is turned off (rendered non-conductive).

H02M 1/00

Details of apparatus for conversion

Definition statement

This place covers:

- Details of power converters that are generic for different types of power converters.
- Power switch driving circuits particularly intended for switch mode power converters.
- Adaptation of power converters for operation from different kind of input sources.
- Means for reducing ripple or harmonics on inputs or outputs.
- Contact mechanisms of dynamic converters.
- Means for protecting power converters.
- Means for starting and stopping power converters.
- Means for preventing simultaneous conduction of switches.
- Means for preventing magnetic saturation.
- Circuits or arrangements for Power Factor Correction.
- Circuits or arrangements for compensating for electromagnetic interference.

H02M 1/08

Circuits specially adapted for the generation of control voltages for semiconductor devices incorporated in static converters

Definition statement

This place covers:

Details of circuits used in static power converters for generating driving voltages or currents necessary for controlling, e.g. via a gate or base terminal, the switching state of power semiconductor devices (e.g., gate drivers).

The scope of this subgroup is not intended to cover logical control circuits in a static converter without additional, specialized driver circuitry for controlling the gate or base of a power semiconductor switching device.

H02M 5/00

Conversion of AC power input into AC power output, e.g. for change of voltage, for change of frequency, for change of number of phases

Definition statement

This place covers:

- Direct conversion of AC input power into different AC output power, e.g. by change of voltage, frequency or number of phases, without intermediate conversion into DC.
- Conversion of AC input power into AC output power with intermediate conversion onto DC (DC-link).
- Conversion of AC input power into AC output power using dynamic conversion means.
