C08K

Use of inorganic or non-macromolecular organic substances as compounding ingredients (paints, inks, varnishes, dyes, polishes, adhesives C09)

Definition statement

This place covers:

- Use of inorganic or non-macromolecular organic substances as compounding ingredients in compositions of single polymers, which are not used to chemically modify the polymer, i.e. inert additives;
- Inorganic or non-macromolecular organic substances which should start or accelerate a crosslinking but which are not chemically embedded in the polymer structure;
- Radical crosslinking agents, e.g. peroxides or S-containing vulcanisation agents;
- Coupling agents, i.e. compounds able to improve the adhesion between filler and macromolecule;
- Coupling agents, i.e. compounds able to improve the adhesion between filler and macromolecule or silane compounds;
- Carbodiimide and derivatives (compounds which have the same chemical role as carbodiimides);
- Vulcanizing agents for diene resins.

Relationships with other classification places

This subclass does not cover chemical elements or compounds or their preparation as such, which subject matter is covered by classes C01 (inorganic chemistry) or C07 (organic chemistry).

Blowing agents are classified in C08J.

Glass which is defined by the chemical nature of its ingredients is classified in C03C.

Polymeric compositions comprising inorganic substances and being suitable for ceramic, cement or stone like applications is classified in C04B.

Polymeric compositions comprising inorganic substances and being suitable for thermoconducting, electroconducting, insulating, magnetic or resistor applications are classified in H01B, H01C or H01F.

Polymeric compositions comprising inorganic substances and being suitable for medical or dental applications are classified in A61K.

Compositions of macromolecular compounds (with or without compounding ingredients) are classified in C08L.

References

Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

**Special rules of classification**

Reference C09 is non-limiting in the subclass C08K. CPC will be updated/corrected once this inconsistency in IPC is resolved.

**Last place priority rule:**

Within each group of this subclass, in the absence of an indication to the contrary, classification is made in the last appropriate place.

**Classification guidance:**

Subgroups of C08K are used for compounding ingredients (additives) in admixture with a single polymer only or with a single polymer from a list of alternative unblended polymers.

A compounding ingredient in admixture with a single polymer is classified as a single symbol in C08K, and as a C-Set when the nature of the polymer is specified (see Combination-Sets information below).

Compounding ingredient(s) in a composition of more than one polymers is classified in the form of C-Sets in C08L (see Combination-Sets information in C08L).

In this subclass, the following are considered as compounding ingredients:

- inert additives
- radical crosslinking agents, e.g. peroxides, S-containing vulcanisation agents
- coupling agents, i.e. compounds able to improve the adhesion between fillers and macromolecules; or silane compounds

The following are not considered as compounding ingredients:

- chemical modifying or crosslinking agents, except silanes, which react via a condensation or addition mechanism are classified with the appropriate polymer (e.g. in C08B, C08C, C08F, C08G)
- solvents or dispersion agents for making polymer solutions, emulsions or dispersions (C08J 3/02)
• blowing agents (C08J 9/04)

Modified (e.g. surface-treated) additives should be classified in C08K 9/00. Additional information (CCA) should be given for the specific treated additive (e.g. coated silica (C08K 3/36)).

Mixtures with two or three ingredients are classified in the appropriate groups of C08K, e.g. a mixture of Al₃O₅, an ether and an amine is classified in C08K 3/22, C08K 5/06 and C08K 5/17.

C08K 13/00 - C08K 13/08 should be used for classification only for mixtures with four or more essential additives.

Ammonium salts are classified in the same way as metal salts.

In this subclass, organic acid salts, alcoholates, phenolates or mercaptides are classified in the groups or subgroups of the parent compounds.

In the fields C09J 7/00 (adhesives) and C09D 7/00 (coatings), the additive is classified in C08K as additional information (CCA). This does not depend on the amount of the additive in the adhesive/coating composition (see Special rule of classification in C09J 7/00 and C09D 7/00).

Places to classify non-radical crosslinking and chain-extending agents:

In C08K are classified radical cross-linking agents. When the added compound reacts as crosslinking agent or chain extension agent via a non-radical mechanism (condensation or addition mechanism), it should not be classified in C08K. They are principally classified by the type of crosslinking agent or by the type of the chemical modification of the polymer to be crosslinked. These are the places where such compounds in combination with polymers can be classified:

- For C08B polymers (polysaccharides): It should be referred to C08B for each specific polymer.
- For Diene rubbers (C08C): see C08C 19/30.
- For Vinyl polymers (C08F): In C08F 8/00, it should be referred to the chemistry of the modified polymer which is crosslinked.
- For Polyurethanes (C08G 18/00): In C08G 18/00, the use of crosslinking agents is classified according to the corresponding chemistry (e.g. polyisocyanates) Carbodiimides as crosslinker can also be found in C08G 18/797.
- For Epoxy resins (C08G 59/00): Crosslinking agents are classified in C08G 59/40.
- For Polymers and polycarbonates (C08G 63/00 - C08G 63/64): Symbols in C08G 63/91 and C08G 64/42 can be given.
- For Polyesters (C08G 65/00): Symbols in C08G 65/32 – C08G 65/338 can be given.
- For Other polymers in C08G: Symbols can be given according to the modification of the polymer induced by the crosslinking reaction or the modification of the polymer which allows the linking reaction.

Allocation of indexing codes:

- Orthogonal Indexing Codes C08K 2201/00 - C08K 2201/019 are used to specify the role and the physical properties of the additives.
- Orthogonal Indexing codes may be allocated in conjunction with combination-set symbols. In these situations, allocations of specific indexing codes are indicated with the related C-Set symbols in C-Set classification.
- Breakdown indexing codes in C08K 3/00 - C08K 13/00 are used as single symbols for classification, but they are not used in forming of C-Set symbols (See C-Set classification below).

Combination Sets (C-Sets):

In this subclass, C-Sets classification is applied to the following groups, listed in the table below, if the document discloses a pertinent combination of technical features that cannot be covered by the allocation of a single symbol. The fourth column of the table indicates the place where the detailed
information about the C-Sets construction and the associated syntax rules can be found, in the section “Special rules of classification”.

</tr>
</tbody>
</table>
The specific C-Sets rule is located at only one place of the base symbol in the section "Special rules of classification" in the definition. If the C-Sets rule is applicable to all groups of a subclass, it is located at the subclass level only. If the same C-Sets rule is applicable to multiple groups or subgroups within the same subclass, the C-Sets rule is placed at the highest group or subgroup of the multiple groups.

**C-Sets statement : #C8Ka**

- In groups **C08K 3/00 - C08K 13/08**, a composition comprising additive(s) and one polymer is classified in the form of C-Sets.
- In these C-Sets, the base symbol, representing the additive is taken from the groups **C08K 3/00 - C08K 13/08**, whereas the subsequent symbol representing the polymer combined with the additive is taken from the groups **C08L 1/00 - C08L 101/16**.

**C-Sets syntax rules:**

- Each of these C-Sets shall contain exactly two symbols
- Duplicate symbols are not allowed in these C-Sets.
- Breakdown and orthogonal index codes are not allowed in the C-Sets either as base symbols or as subsequent symbols.
- The order of symbols in these C-Sets is relevant as it reflects the presence of one additive and one polymer
- If a composition comprising one polymer, e.g. polymer X, and two or more additives, e.g. Additive A and B, separate C-Sets are given to each additive and the polymer X, e.g. (additive A, polymer X) and (additive B, polymer X).
- For a composition comprising one polymer and four or more essential additives, e.g. additives A, B, C, D and polymer X, a C-Set is given using C08K13/yy and separate C-Sets are given to each additive and the polymer X. For example, (C08K13/yy, polymer X), (additive A, polymer X), (additive B, polymer X), (additive C, polymer X), and (additive D, polymer X).
- If an additive within **C08K** is disclosed in admixture with one polymer selected from a list of several polymers, but each of those polymers does not form a blend, all exemplified combinations must be classified as separate C-Sets, e.g. polystyrene or PVC containing a carboxylic amide is separately classified in **C08K 5/20, C08L 25/06** and **C08K 5/20, C08L 27/06**.
- In the absence of examples, at least one C-Set is given on the basis of sufficient description of the polymer and the additive in the document.
- If an additive is used in admixture with two or more polymers in a blend, the composition is classified in a form of C-Sets following C-Sets rule in **C08L**, wherein the additive is assigned as subsequent symbol (see C-Sets #C8Lb).

**C-Sets examples:**

- #C8Ka: An admixture comprising carbon black (C08K 3/04) combined with butadiene-styrene rubber (C08L 9/06) is classified as (C08K 3/04, C08L 9/06).
• #C8Ka: An admixture comprising glass fibers (C08K 7/14) and resorcinol phosphate (C08K 5/523) combined with nylon 6, 6 (C08L 77/06) is classified as (C08K 7/14, C08L 77/06) and (C08K 5/523, C08L 77/06).

• #C8Ka: An admixture of styrene-butadiene rubber with carbon black (C08K 3/04), sulfur (C08K 3/06), silica (C08K 3/36) and silane coupling agent with sulfide bridge (C08K 5/548) is classified as (C08K 13/02, C08L 9/06), (C08K 3/06, C08L 9/06), (C08K 3/04, C08L 9/06), (C08K 5/548, C08L 9/06), and (C08K 3/36, C08L 9/06).

Glossary of terms

<tr>
<td>Metal</td>
<td>Any element other than hydrogen, carbon, halogen (fluorine, chlorine, bromine, iodine and astatine), oxygen, nitrogen, sulfur, selenium, tellurium, phosphorus, silicon, boron, noble gases (helium, neon, argon, krypton, xenon and radon).</td>
</tr>
<tr>
<td>Organic compound</td>
<td>Compound satisfying one of the following criteria: at least two carbon atoms bonded to each other, or one carbon atom bonded to at least one hydrogen atom or halogen atom, or one carbon atom bonded to at least one nitrogen atom by a single or double bond. Exceptions to the above criteria are: compounds consisting of only carbon atoms (e.g. fullerenes), cyanogen, cyanogen halides, cyanamide, metal carbides, phosgene, thiophosgene, hydrocyanic acid, isocyanic acid, isothiocyanic acid, fulminic acid, unsubstituted carbamic acid, and salts of the previously mentioned acids; these exceptions are considered to be inorganic compounds for classification purposes.</td>
</tr>
</tbody>
</table>
Quinone

Compound derived from compounds containing a six-membered aromatic ring or a system comprising six-membered aromatic rings (which system may be condensed or not condensed) by replacing two or four >-CH groups of the six-membered aromatic rings by >C=O groups, and by removing one or two carbon-to-carbon double bonds, respectively, and rearranging the remaining carbon-to-carbon double bonds to give a ring or ring system with alternating double bonds, including the carbon-to-oxygen bonds; this means that acenaphthenequinone or camphorquinone are not considered as quinones.

**C08K 3/00**

Use of inorganic substances as compounding ingredients

**Definition statement**

*This place covers:*

Polymeric compositions comprising inert inorganic substances as compounding ingredients.

**Relationships with other classification places**

The preparation of inorganic ingredients per se are classified in different areas such as C01B, C01F.

**References**

**Informative references**

*Attention is drawn to the following places, which may be of interest for search:*

| Polymeric compositions comprising inorganic substances and being suitable for laser marking applications | B41M 5/00 |
| Polymeric compositions comprising inorganic substances and being suitable for film applications | C08J 5/18 |
| Polymeric compositions comprising inorganic substances and being suitable for miscellaneous applications like liquid crystals, fire proofing materials or luminescent materials | C09K |
| Polymeric compositions comprising inorganic substances and being suitable for fire resistant wire or cable applications | H01B 7/00 |
| Polymeric compositions comprising inorganic substances and being suitable for electromagnetic shielding (EMI) applications | H05K 9/00 |

**Special rules of classification**

This group follows the special rules of Classification as outlined at subclass C08K.

The inorganic substances are classified into the appropriate groups according to their chemical nature, e.g. diamonds which consist of the chemical element carbon are to be classified in C08K 3/04 (carbon).
Subgroups:

C08K 3/011
For an inorganic substance which is to be classified but is not specifically chemically defined and only described as 'Crosslinking or vulcanising agent, including accelerators'.

C08K 3/012
For an inorganic substance which is to be classified but not specifically chemically defined and only described as 'Additives activating the degradation of the macromolecular compound'.

C08K 3/013
For an inorganic substance which is to be classified but not specifically chemically defined and only described as 'Filler, pigment or reinforcing additive'.

C08K 3/014
For an inorganic substance which is to be classified but not specifically chemically defined and only described as 'Stabiliser against oxidation, heat, light or ozone'.

C08K 3/015
For an inorganic substance which is to be classified but not specifically chemically defined and only described as 'Biocide'.

C08K 3/016
For an inorganic substance which is to be classified but not specifically chemically defined and only described as 'Flame-proofing or flame-retarding additive'.

C08K 3/017
For an inorganic substance which is to be classified but is not specifically chemically defined and only described as 'Antistatic'.

C08K 3/08 For metals and alloys of metals. For each of the metals included in the alloy, a 2000-series breakdown code of C08K 3/08 (e.g. one of C08K 2003/0806-C08K 2003/0893) can be given.

C08K 3/22 For metal oxides. Also for mixed metal oxides.

C08K 3/24 For acids and salts thereof. Also for compounds based on metallates like Me$_x$O$_y$$^{-n}$ (metallates, oxometallates) (with the exception of antimonates).

C08K 3/30 For Sulfur-,selenium or tellurium-containing compounds. Also for compounds like thiomolybdate (like their equivalents with selenium and tellurium).

C08K 3/40 For glass used as inorganic substance.

If glass is used as inorganic substance and its ingredients are specifically mentioned according to their chemical nature, then rule (1) above applies.

C-Sets classification:
In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the “Special rules of classification” in C08K.
C-Sets searches:
C-Sets search queries may be made according to C-Sets classification rules described in C08K and related subclasses.

C08K 5/00
Use of organic ingredients

Definition statement
This place covers:
Use of organic ingredients: polymeric compositions comprising organic substances as compounding ingredients.

Relationships with other classification places
The preparation of the organic ingredients themselves, with or without their use as additives, is classified in C07.

The general processes of compounding and after treatment is classified in C08J.

References
Informative references
Attention is drawn to the following places, which may be of interest for search:

| Polymeric compositions comprising organic substances and being suitable for laser marking applications | B41M 5/00 |
| Polymeric compositions comprising organic substances and being suitable for film applications | C08J 5/18 |
| Polymeric compositions comprising organic substances and being suitable for miscellaneous applications like liquid crystals, fire proofing materials, luminescent or tenebrescent materials | C09K |
| Polymeric compositions comprising organic substances and being suitable for conductors or conductive bodies | H01B 1/12 |
| Polymeric compositions comprising organic substances and being suitable for fire resistant cable or wire applications | H01B 7/00 |

Special rules of classification
This group follows the special rules of Classification as outlined at subclass C08K.

The organic substances are classified into the appropriate groups according to their chemical nature, e.g. compounds containing ester and phenol groups are classified in C08K 5/134.

Subgroups:
C08K 5/37
In this group, ‘Thiols’ is meant to also comprise derivatives obtained from substitution of the thiolic H atom.

C-Sets classification:
In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the “Special rules of classification” in C08K.
C-Sets searches:
C-Sets search queries may be made according to C-Sets classification rules described in C08K and related subclasses.

C08K 5/0016
For an organic substance which is to be classified but not specificallychemically defined and only described as ‘plasticiser’.

C08K 5/0025
For an organic substance which is to be classified but not specificallychemically defined and only described as ‘crosslinking or vulcanising agent’ or ‘accelerator’.

C08K 5/005
For an organic substance which is to be classified but not specificallychemically defined and only described as ‘stabiliser against oxidation, heat, light, ozone’.

C08K 5/0083
For an organic substance which is to be classified but not specificallychemically defined and only described as ‘nucleating’, ‘clarifying’, or ‘crystallisation improving’ agent.

C08K 5/37
In this group, ‘Thiols’ is meant to also comprise derivatives obtained from substitution of the thiolic H atom.

C08K 7/00
Use of ingredients characterised by shape

Definition statement
This place covers:
All additives of C08K which are characterized by their shape, e.g. fibres, spherical particles, expanded particles, porous particles and hollow particles

Polymer fibres like aramide fibres are to be classified in C08K 7/02.

Reinforced polymer or resin compositions and composites are classified in C08K 7/00 when the amount of the fibres is generally lower than 50 % (volume or weight). Composites based on an higher content of fibres or based on fabric (woven or non-woven) are classified in C08J 5/04 or in C08J 5/24.

C08J 5/04 and C08J 5/24 refer to the reinforcement of polymer matrix (making composites) by using high amounts of fibres (generally more than 50 % (volume or weight)) in the sense that the fibres constitute the structure of the final product.

Relationships with other classification places
This group does not cover the preparation of the ingredients characterised by shape per se.

Attention is drawn to the following places, which may be of interest for search:

| Carbontubes or preparation of such carbon nanotubes | C01B 32/15 |
| Carbon filaments or preparation of such filament | D01F 9/12 |
Special rules of classification
This group follows the special rules of Classification as outlined at subclass C08K.

Subgroups:

C08K 7/24

For example, carbon nanotubes as additive material.

C-Sets classification:
In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the "Special rules of classification" in C08K.

C-Sets searches:
C-Sets search queries may be made according to C-Sets classification rules described in C08K and related subclasses.

C08K 9/00
Use of pretreated ingredients

Definition statement
This place covers:
All additives of C08K which are characterized by being pretreated before their use as additive, the pretreatment encompassing physical as well as chemical pretreatment (resulting in physical but also in chemical attachment of the pretreating agent to the surface of the additive).

The chemical nature of pretreating agent is according to the classification scheme and as explained below.

Relationships with other classification places
This group does not cover the preparation of the pretreated ingredients per se.

References
Informative references
Attention is drawn to the following places, which may be of interest for search:

| Treatments of inorganic materials with inorganic compounds to enhance their pigmenting or filling properties | C09C 3/06 |
| Treatments of inorganic materials with low-molecular-weight non polymer organic compounds to enhance their pigmenting or filling properties | C09C 3/08 |
| Treatments of inorganic materials with macromolecular organic compounds to enhance their pigmenting or filling properties | C09C 3/10 |
| Treatments of inorganic materials with organosilicon compounds to enhance their pigmenting or filling properties | C09C 3/12 |

Special rules of classification
This group follows the special rules of Classification as outlined at subclass C08K.

Subgroups:

C08K 9/04
This subgroup defines physical/chemical pretreatment by non-macromolecular organic substances only

**C08K 9/06**

This subgroup defines physical/chemical pretreatment by non-macromolecular organic silicon containing substances only

**C08K 9/08**

This subgroup defines physical/chemical pretreatment by macromolecular organic substances only

**C08K 9/10**

This subgroup is used only, if the claims and/or examples of the respective document explicitely show/define/claim a literally 'encapsulation' of the respective pretreating agent on the additive

**C08K 9/12**

This subgroup is used only, if the claims and/or examples of the respective document explicitely show/define/claim a literally 'absorption' of the respective pretreating agent on the additive

For intercalated, exfoliated, or organic modified clays, symbols **C08K 9/04**, **C08K 9/06** or **C08K 9/08** should be given.

**C-Sets classification:**
In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the “Special rules of classification” in **C08K**.

**C-Sets searches:**
C-Sets search queries may be made according to C-Sets classification rules described in **C08K** and related subclasses.

**C08K 11/00**

Use of ingredients of unknown constitution, e.g. undefined reaction products

**Definition statement**

*This place covers:*

Any additive in the meaning of **C08K** which does not fall within any of the subgroups **C08K 3/00**, **C08K 5/00**, **C08K 7/00**, **C08K 9/00** or **C08K 13/00**.

**Relationships with other classification places**

This group does not cover the preparation of the ingredients of unknown constitution per se.

**Special rules of classification**

This group follows the special rules of Classification as outlined at subclass **C08K**.

**C-Sets classification:**
In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the “Special rules of classification” in **C08K**.

**C-Sets searches:**
C-Sets search queries may be made according to C-Sets classification rules described in **C08K** and related subclasses.
**C08K 13/00**

**Use of mixtures of ingredients not covered by one single of the preceding main groups, each of these compounds being essential**

**Definition statement**

*This place covers:*

This subgroup should be used for classification only for mixtures with more than three essential ingredients.

**Special rules of classification**

This group follows the special rules of Classification as outlined at subclass C08K.

**C-Sets classification:**

In this group, C-Sets (e.g. #C8Ka) are used. The detailed information about the C-Sets construction and the associated syntax rules are found in the "Special rules of classification" in C08K.

**C-Sets searches:**

C-Sets search queries may be made according to C-Sets classification rules described in C08K and related subclasses.
