PATENT AND TRADEMARK OFFICE

# Outline

- Overview of essential CPC scheme features
- Brief overview of CPC tools we will use today
- Classification search exercises covering electrical, mechanical and chemical areas
- Advanced features of the CPC scheme

# CPC: Where to Classify

- Patent applications / granted patents are classified by selecting appropriate CPC symbols which represent the invention and permit users to retrieve the document later
- All inventive features must be classified, i.e. multiple symbols are typically allocated
- Additional information that is interesting from the disclosure for search purposes is classified (efficient retrieval of documents)

# The CPC Symbol

**H01L 21/02087** is an example of a CPC symbol  
H01L is the subclass identifier  
H01 is the class  
H is the section

# Scheme Presentation

- Primary group titles in **black** are also in IPC
- Primary group titles and other information that are in green and surrounded by **{curly brackets}** are CPC only
- References **(pointers to other places)**
- In HTML version there are hyperlinks (to definitions and references)
  - Example:

# The CPC Group (i.e., a Classification)

The CPC group H01L 21/02087 on its own looks like this:

	Symbol	Indent Level	Title [title date]
Group	H01L 21/02087	.... (4)	Cleaning of wafer edges [2013-01]

## A CPC group:

### Requisite

- Position in the scheme
- CPC symbol
- Indent level
- Title
- Revision date [YYYY-MM]

### May Have

- **Notes** related to CPC
  - References to indexing groups that must be applied
- **Warnings**
- Glossary terms
- Definition is [Hyperlinked](#)
- References ([pointers to other places](#))

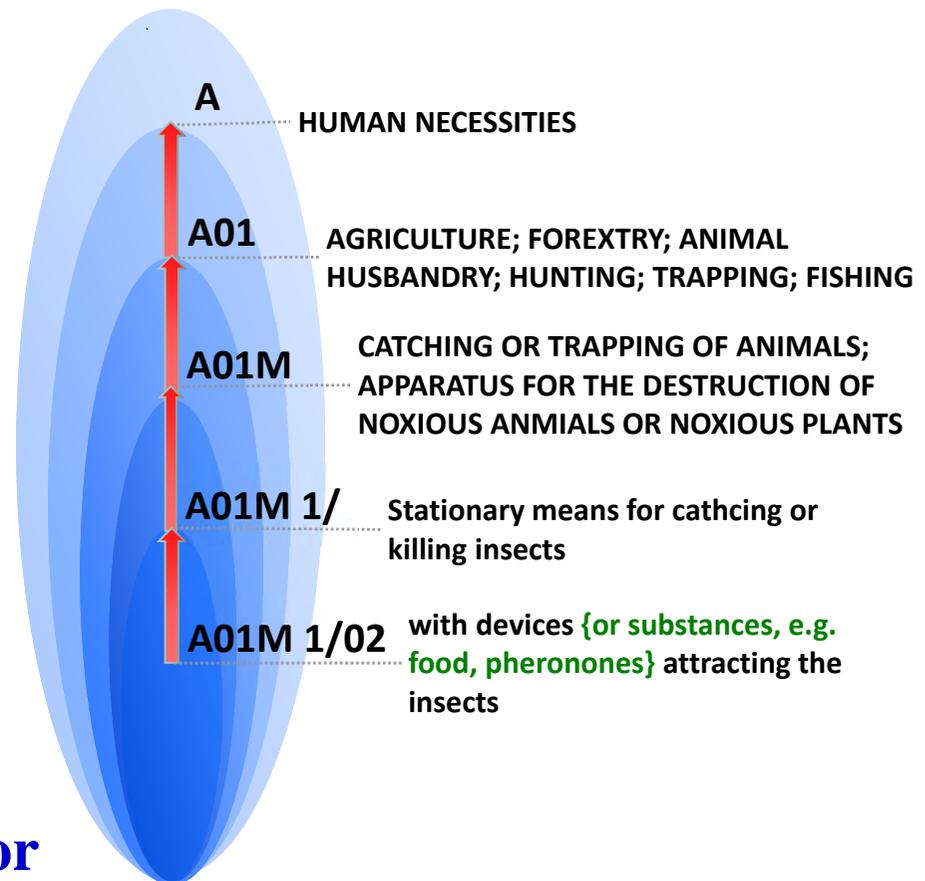

# Titles and Scope

**Scope** of CPC entry (place) is

- the technical subject matter that is covered by a place
- always defined by title of place + titles of hierarchically higher places

**Sections, classes:** titles only broadly indicative of content

**Subclasses, groups (Main groups or subgroups):** titles define specific content which fall in the area as precisely as possible

## Slide 9

F16M11/2071 ....{for panning and rolling}

EPO and USPTO launched the Cooperative Patent Classification System. The CPC is the result of a partnership between the EPO and the USPTO in their joint effort to develop a common, internationally compatible classification system for technical documents, in particular patent publications, which will be used by both offices in the patent granting process.

News  
1 August 2016  
The 2016.08 version of the CPC scheme is now in force.  
As announced the 2016.08 version of the CPC Scheme which was pre-released on 18 July 2016 is now in force.

# Examples and Search Techniques

UNITED STATES  
PATENT AND TRADEMARK OFFICE

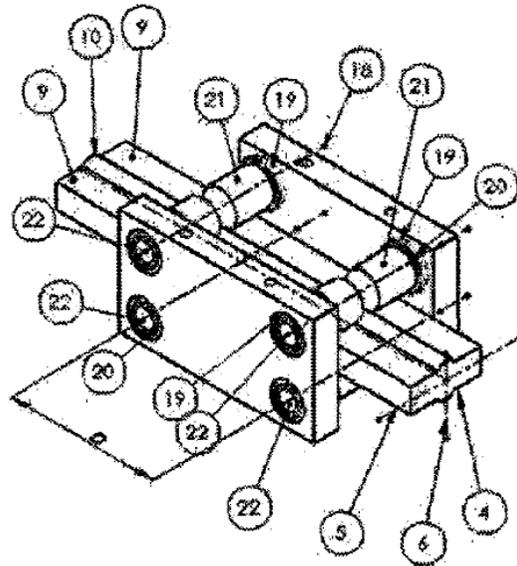

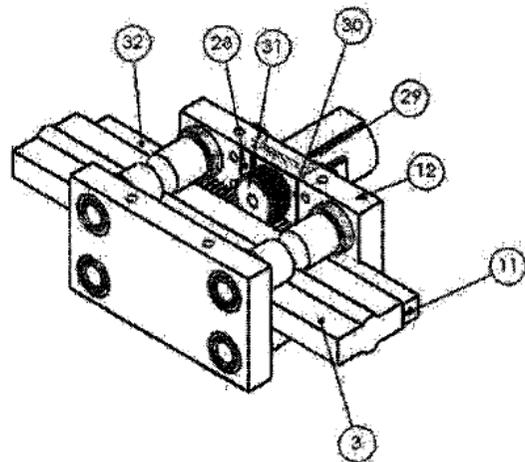

# Mechanical Example 1

UNITED STATES  
PATENT AND TRADEMARK OFFICE

The invention relates to a compact linear roller guide which makes it possible to transmit high forces and torques between a carriage (1) and a guide rail (3). The carriage (1) comprises two or more pairs of ribbed rollers (2), rotatably supported on the side walls of the carriage by means of bearings, between which the rail (3) is inserted, with a complementary cross-section. The simultaneous contact of the planar and convex surfaces of the rail (3) with the cylindrical and concave surfaces of the rollers (2) enables uniform distribution of the loads on said bearings and a compact configuration of the guide.

1. A compact linear roller guide capable of transmitting forces and high torques between a sliding carriage, defined by a longitudinal axis and a rectangular cross section, comprising a guide and transmission rail having a cross section composed of a section of rectangular area alternated with two upper and lower sections of convex area which is inserted longitudinally into the carriage, wherein said guide and transmission rail is housed between an assembly of rotational support members comprising at least one or more pairs of grooved rollers each pair of grooved rollers being supported on shanks, internal raceways and a bearing for axial and radial loads, wherein said rollers radially traverse the carriage to be inserted in a perpendicular manner into two of the facing lateral walls of the carriage.

7. The compact linear roller guide capable of transmitting forces and high torques of claim 1, wherein it permits a system of power transmission to be connected between the sliding carriage and the guide and load transmission rail, wherein in at least one of the facing plates wherein the bearings are mounted a centered orifice is realized between the planes wherein are aligned the pairs of grooved rollers, to insert a motor and the support thereof, wherein by means of a pinion on the motor shaft power is transmitted to a rack longitudinally abutting onto at least one of the flanks of the guide and load transmission rail.

# Determine the Invention

- Inventive subject matter can be found anywhere within the document
  - Drawings
  - Specification
  - Claims

# Determine the Invention

- The present document discloses a **compact linear roller guide** which, by virtue of the configuration and geometric distribution thereof, is capable of transmitting forces and high tension moments, in addition to achieving high precision in the linear displacement of the load. This linear guide in turn presents novel characteristics, such as the implementation of **grooved rollers guided by means of a guide rail** having surfaces especially designed to uniformly distribute the load on all the rollers comprised in the sliding carriage. The constructive characteristics of the present linear guide **permit a system of power transmission** to be realized between the sliding carriage and the guide rail by **inserting a motor and the support thereof into at least one of the walls of the sliding carriage and within the space between the grooved rollers** in such manner that, **by means of a pinion mounted on the motor shaft, power may be transmitted to the rail by a longitudinally abutting rack**, maintaining the very small physical dimensions, permitting the utilization of said linear guide in diverse applications requiring both precision and high load capacity.

# Espacenet Classification Search

The screenshot shows the Espacenet Patent search interface. At the top, there is a navigation bar with the Espacenet logo and language options (Deutsch, English, Français). Below this is a search bar and a navigation menu. The main content area is titled "Cooperative Patent Classification" and features a search bar with the text "a keyword or a classification symbol". Below the search bar is a table of classification symbols and their descriptions. The table has two columns: "Symbol" and "Classification and description". The symbols listed are A, B, C, D, E, F, G, H, and Y. The descriptions are: A: HUMAN NECESSITIES; B: PERFORMING OPERATIONS; TRANSPORTING; C: CHEMISTRY; METALLURGY; D: TEXTILES; PAPER; E: FIXED CONSTRUCTIONS; F: MECHANICAL ENGINEERING; LIGHTING; HEATING; WEAPONS; BLASTING ENGINES OR PUMPS; G: PHYSICS; H: ELECTRICITY; Y: GENERAL TAGGING OF NEW TECHNOLOGICAL DEVELOPMENTS; GENERAL TAGGING OF CROSS-SECTIONAL TECHNOLOGIES SPANNING OVER SEVERAL SECTIONS OF THE IPC; TECHNICAL SUBJECTS COVERED BY FORMER USPC CROSS-REFERENCE ART COLLECTIONS [XRACS] AND DIGESTS. There are also some icons next to the descriptions, such as a magnifying glass and a document icon.

## Wildcards

- \* a string of characters of any length
- ? zero or one character
- # exactly one character

## Proximity operators

Example: guide prox/distance<3 rail  
The system will find patent documents where the words guide and rail are less than three words apart in the TXT identifier.

Example: guide prox/unit=sentence rail  
The system will find patent documents where the words mouse and trap happen to be in the same sentence in the TXT identifier.

Example: guide prox/unit=paragraph rail  
The system will find patent documents where the words mouse and trap happen to be in the same paragraph in the TXT identifier.

[57] **ABSTRACT**  
 A track system for roller-equipped carriers to run along a straight and/or curving guide rail, which includes two pairs of opposed parallel plain lanes, a pair of oppositely directed parallel V edges intermediate the two pairs of plain lanes, and narrow lubricating grooves along each V edge. Each carrier has a frame and roller assemblies, each having a pair of ball bearings mounted on a journal, spaced apart from each other and beveled oppositely on their adjacent outer race corners, so that the base areas of V edges engage between the beveled corners, and the top areas of V edges remain free within the space between the outer races in each pair, the outer races mostly rolling on the plain lanes. Each curving rail segment is provided with straight extensions formed on both ends to be connected to straight rail segments.

(57) **ABSTRACT**

A guide rail is provided. The guide rail includes a base rail and a gear rack mounted to the base rail. The guide rail also provides at least one race upon which a guide roller can ride. The guide rail defines a reference point related to the raceway that has a parallelism relative to the gear rack of less than or equal to 0.005 inches per foot along the length of the guide rail. Preferably, the reference point is defined directly by the raceway and the parallelism is less than or equal to 0.001 inches per foot. A method of forming the guide rail is also provided. The method includes machining the reference point into the guide rail and using the reference point to locate machining a seat for mounting the gear rack. A guide assembly including a guide rail and a carriage or frame structure is also provided.

 (57) **ABSTRACT**

A double door actuation system is provided. The actuation system includes a base frame, a drive motor, first and second guide rails and a pair of rail support arrangements. The drive motor is mounted to the base frame and includes a pinion gear rotatable about an axis of rotation. The guide rails include opposed raceways and a gear rack. The gear rack engages the pinion gear opposite sides such that the pinion gear simultaneously drives the guide rails in opposite directions parallel to a drive axis. The rail support arrangements are mounted to the base frame and support guide rails. The rail support arrangements maintain a substantially constant lateral location of the guide rails in a direction perpendicular to both the drive axis and axis of rotation to maintain a substantially constant mesh between the pinion the gear racks.

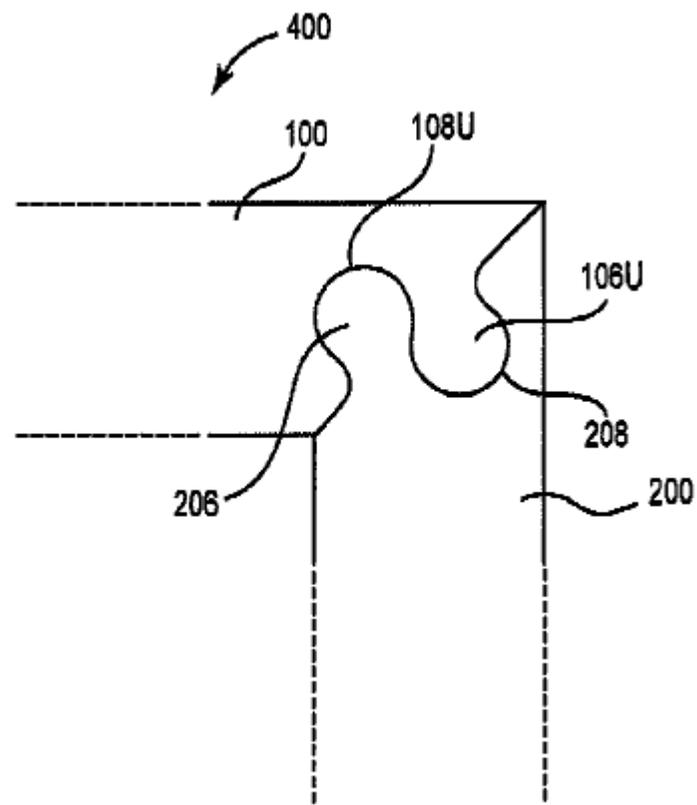

# Mechanical Example 2

UNITED STATES  
PATENT AND TRADEMARK OFFICE

The invention provides a method for providing improved and locking joints in window and door casings. Complementary geometric shapes are provided on each adjacent joint member to provide locking engagement thereof. This locking engagement helps prevent the gaps that typically result in known 45 degree miter joints as a result of expansion and contraction due to water uptake and release.

US 2011/0185654

What is claimed is:

1. A casing structure, the structure comprising:
  - a upper horizontal member comprising a right side and a left side, the right side comprising at least one male engager having a geometry and at least one female engaging surface having a geometry, the left side comprising at least one male engager having a geometry and at least one female engager having a geometry;
  - a right vertical member comprising an upper section and a lower section and at least one male engager and at least one female engager on at least the upper section, the at least one male engager having a geometry that is complementary with the geometry of the right side female engaging surface of the upper horizontal member, the at least one female engaging surface having a geometry that is complementary with the geometry of the right side male engager of the upper horizontal member; and
  - a left vertical member comprising an upper section and a lower section and at least one male engager and at least one female engager on at least the upper section at least one male engager and at least one female engager, the at least one male engager having a geometry that is complementary with the geometry of the left side female engaging surface of the upper horizontal member, the at least one female engaging surface having a geometry that is complementary with the geometry of the left side male engager of the upper horizontal member.

13. A method for providing locking joints in a casing structure, comprising:

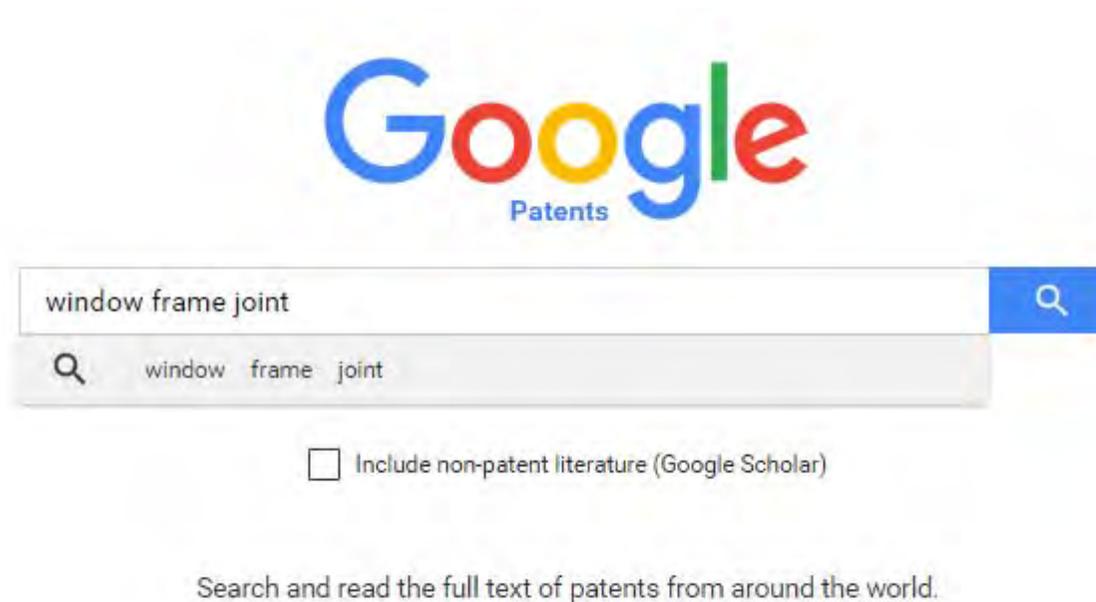

- providing a upper horizontal member comprising a right side and a left side, the right side comprising at least one male engager having a geometry and at least one female engaging surface having a geometry, the left side comprising at least one male engager having a geometry and at least one female engager having a geometry;
- providing a right vertical member comprising an upper section and a lower section and at least one male engager and at least one female engager on at least the upper section, the at least one male engager having a geometry that is complementary with the geometry of the right side female engaging surface of the upper horizontal member, the at least one female engaging surface having a geometry that is complementary with the geometry of the right side male engager of the upper horizontal member;
- providing a left vertical member comprising an upper section and a lower section and at least one male engager and at least one female engager on at least the upper section at least one male engager and at least one female engager, the at least one male engager having a geometry that is complementary with the geometry of the left side female engaging surface of the upper horizontal member, the at least one female engaging surface having a geometry that is complementary with the geometry of the left side male engager of the upper horizontal member;
- lockingly engaging the at the at least one male engager of the lower portion of the right vertical member with the at least one female engaging surface of the left side of the lower horizontal member;
- lockingly engaging the at least one female engaging surface of the lower portion of the right vertical member with the at least one male engager of the right side of the lower horizontal member;
- lockingly engaging the at least one male engager of the lower portion of the left vertical member with the at least one female engaging surface of the left side of the lower horizontal member; and
- lockingly engaging the at least one female engaging surface of the lower portion of the left vertical member with the at least one male engager of the left side of the lower horizontal member.

[57] **ABSTRACT**  
A first structural member having a portion beveled at an angle of 45° which includes a mortise in the form of a generally cylindrical groove is joined to a second structural member having a portion beveled at an angle of 45° which includes a tenon in the form of a generally cylindrical rib, with the beveled portions in an abutting relationship by a joint formed by the rib being snugly fitted in the groove. The members may be joined at a straight angle or at a right angle, and may be employed for producing modular structural frames; articles of furniture; modular toy constructions; wall attachments; flooring boards and other arrangements wherein the flexibility of straight angle and right angle permutations of interlocking members of standardized elongated configurations are utilized.

(57) **ABSTRACT**  
This invention describes a snap-lock interlocking joint which locks a pair of mating construction pieces together by the insertion of a specially shaped tongue into a corresponding groove (having a complimentary shape to the tongue). The invention works well with engineered wood composites such as medium density fiberboard and certain other plastic products, namely free foam cellular plastic. The pieces may be joined together in the complete absence of glue or nails. No clamping is required to provide a strong joint.

# Surgical Example

UNITED STATES  
PATENT AND TRADEMARK OFFICE

A medical device includes an orthopedic fixation device and an electromagnetic field emitter carried by the fixation device. The device preferably further includes a power source for powering the electromagnetic field emitter, which may be implanted in the human body with the fixation device and the electromagnetic field emitter. The power source may be a battery.

[0025] The invention relates generally to fixation devices. More specifically, the invention relates to fixation devices that are useful for assisting in fracture and wound healing, treating infection, reducing pain, and for other therapeutic purposes.

US 2013/0165733

1. An orthopedic device comprising:  
an internal orthopedic fixation device; and  
a magnetic field emitter carried by the fixation device.

14. A method of treating an injury comprising:  
placing an orthopedic fixation device in a patient;  
placing an electromagnetic field emitter carried by the  
device into the patient; and  
activating the electromagnetic field emitter to emit an elec-  
tromagnetic field proximate the injury.

20. A device for stabilizing a fracture and promoting heal-  
ing, comprising:  
an intramedullary orthopedic fixation device having an  
opening therein;  
an electromagnetic field emitter disposed in the opening of  
the orthopedic fixation device;  
a controller disposed in the opening of the orthopedic fixa-  
tion device and communicating with the electromag-  
netic field emitter to control the field emitted by the  
electromagnetic field emitter, and  
a power source providing power to the controller and the  
electromagnetic field emitter.

ABSTRACT

An apparatus for promoting healing of body tissue composed of a coil arranged to be applied to the affected body part and to be connected to a low frequency a.c. source to produce a magnetic field within the region to be treated, and at least two sheet-like electrodes associated with the coil and spaced from one another, the electrodes being arranged to be located at respectively opposite sides of the region to be treated and to be connected to a source of a low frequency voltage to produce an electric field within the region to be treated at the same time as the magnetic field.

The marrow nail 22 described is mounted as is conventional in the injured bone 20 and the injured extremity comprising the marrow nail 22 with the receiving coil 24 is then brought into the field of a coil 10 placed over the injured extremity. The coil 10 is connected with a function generator 18 of the type described with reference to FIG. 1. The voltage induced by the magnetic field of the coil 10 in the receiving coil 24 passes to the insulated electrodes 14' so that in the bone zone an electrical field is produced which runs generally perpendicularly to the magnetic field. The coil 10 can, as has been explained with reference to FIG. 1, additionally be provided with electrodes 14, which are directly supplied with a voltage by the function generator 18 and this voltage preferably has the same frequency as the AC in the coil 10, but with respect to this voltage is shifted in amplitude by approximately 90°.

FIGS. 5 and 6 show two embodiments of the present device, which comprise a pin-like body 32 with rounded ends, which can consist of a fluorine carbon polymer for example. In the body there is a substantially cylindrical shaped receiving coil 24 which can comprise a rod-shaped magnetic core which is not especially shown.

The ends of the receiving coil are connected respectively with two electrodes, which are embedded in the body 32. Preferably the surface of each electrode is insulated so that no galvanic currents can flow from it. The electrodes 24a of the embodiment in accordance with FIG. 5 have the shape of parts of the cylindrical casing and are arranged on opposite sides of the body 32. The electrodes 14b of the embodiment in accordance with FIG. 6 are annular and arranged on the body 32 with an axial spacing.

The embodiment in accordance with FIGS. 5 and 6 can be mounted in the marrow channel of a bone, for example in the case of osteomyelitis, and furthermore they are suitable for producing autologous replacement of fibers by growing round or encapsulation.

The invention relates to an implantable device to be fixed to a bone and comprising an electrically conductive base body provided with at least two through holes and at least one pair of shaft-shaped contact means, wherein each contact means passes through a through hole of the base body and penetrates a section of the bone in an implanted state, wherein the surface of each contact means comprises a first and a second electrically conductive surface section as well as an electrically insulating surface section separating the electrically conductive surface sections from each other, wherein the first electrically conductive surface section electrically contacts the base body while the second electrically conductive surface section is electrically insulated with respect to the base body, wherein each contact means contains a coil arrangement in its interior by means of which the electrically conductive surface sections of each contact means are electrically coupled, and wherein the coil arrangements of a pair are wound in opposite directions.

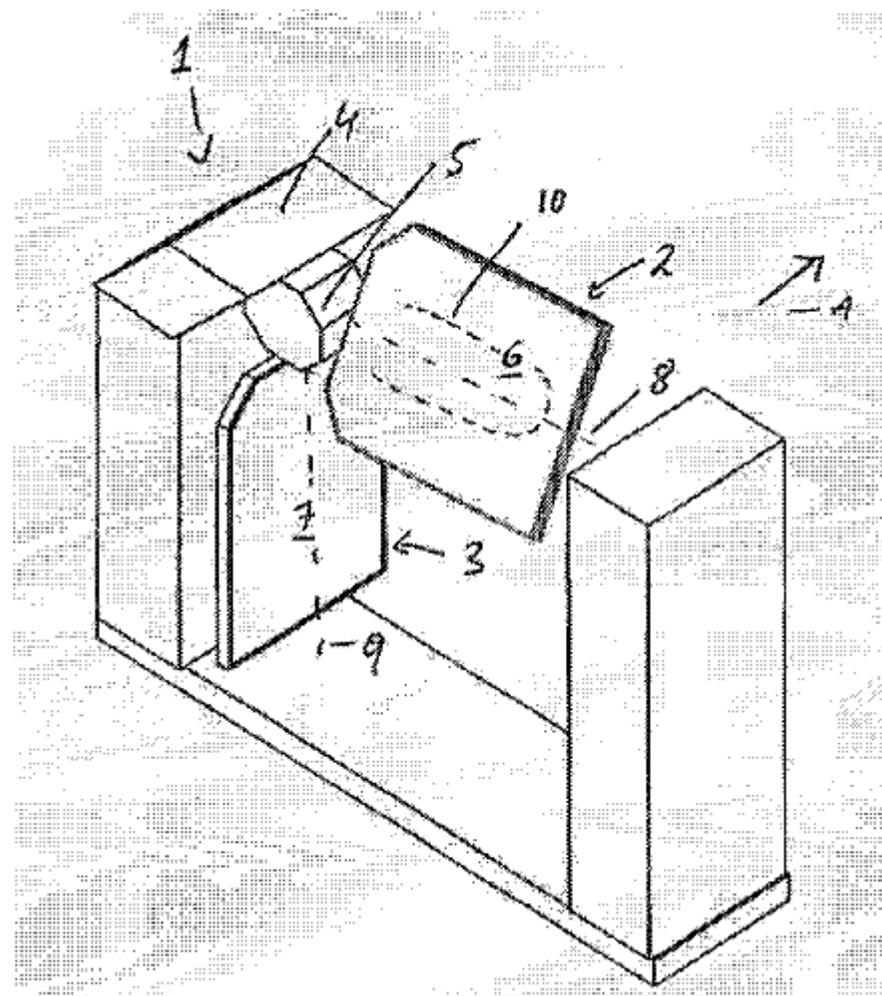

# Mechanical Example 3

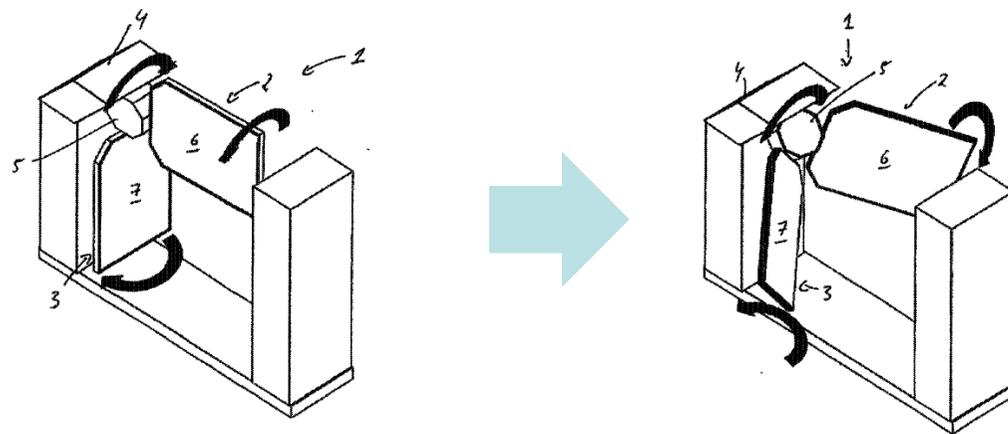

UNITED STATES  
PATENT AND TRADEMARK OFFICE

A personnel access-control device in the form of a turnstile (1) has one or more blocking arms (2, 3) connected to a main shaft (5) mounted in a carrier (4). The blocking arms (2, 3) assume a blocking position and at least one free position in dependence upon the rotation of the main shaft (5). Each blocking arm (2, 3) includes a flat component (6, 7) that is mounted to rotate about its longitudinal axis (8, 9) in dependence upon the rotation of the main shaft (5). In the blocking position of the blocking arms (2, 3), a pre-defined angular position of the flat component (6, 7) with respect to the perpendicular direction is achieved, and in the free position, the flat component (6, 7) is rotated such that passage of a person is allowed and/or that the passage width is not limited.

[0038] In a particularly advantageous embodiment of the invention, it is proposed to integrate at least one RFID antenna unit into the flat components 6, 7 of the blocking arms 2, 3 that communicates with RFID transponders as data medium to read an access authorization, whereby the control of at least one antenna unit may be integrated into the flat components 6, 7. Such an antenna unit is shown in FIG. 2 with dashed lines, and is identified by index symbol 10.

1. A personnel access control devices in the form of a turnstile having a stationary carrier and a rotatable gate with at least one blocking arm, said gate being mounted for rotation with respect to the carrier about a main shaft such that the blocking arm is movable between a blocking position which blocks access and at least one free position which allows access, the improvement wherein each blocking arm includes a flat component which is mounted to rotate about a longitudinal arm axis in dependence upon the rotation of the gate about the main shaft such that, in said blocking position, said flat component is rotated to a first defined angle with respect to the vertical to present a barrier to a person and, in said free position, the flat component is rotated such that at least one of (a) a passage of a person is allowed and (b) a passage width is not restricted.

(57) **ABSTRACT**

A method of measuring precessing magnetization includes providing a first site characterized by a first spin order and providing a second site. The method also includes transferring a portion of the first spin order from the first site to the second site. The second site is characterized by a second spin order orthogonal to the first spin order. The method further includes exposing a sample including the first site and the second site to a magnetic field, measuring a precessing magnetization of at least one of the first site or the second site, repeating the transferring a portion of the first spin order from the first site to the second site, and repeating the measuring of the precessing magnetization.

# Partial/Fractional Polarization Transfer for Single-Scan Magnetic Resonance Spectroscopy and Imaging Classification

## Invention

G01R 33/4608 – NMR Spectroscopy  
- {RF excitation sequences for enhanced detection, e.g. NOE, polarisation transfer, selection of a coherence transfer pathway}

- G01R 33/5601 - Image enhancement or correction, e.g. subtraction or averaging techniques - {involving use of a contrast agent for contrast manipulation, e.g. a paramagnetic, super-paramagnetic, ferromagnetic or hyperpolarised contrast agent}
- G01R33/5605 - Image enhancement or correction, e.g. subtraction or averaging techniques - {by transferring coherence or polarization from a spin species to another, e.g. creating magnetization transfer contrast [MTC], polarization transfer using nuclear Overhauser enhancement [NOE]}

# Partial/Fractional Polarization Transfer for Single-Scan Magnetic Resonance Spectroscopy and Imaging Classification

## G01R 33/5601

context, transfer of order to the heteronucleus followed by its observation as polarization may increase the time during which hyperpolarization is available, allow better chemical discrimination, and increase the contrast against the background signals from other weakly polarized molecules.

The sequence timings are calculated for the scalar couplings of a specific grouping, so the method presented is most readily optimized in experiments in which the fate of a single molecular species over time is examined. This is the case in experiments where the hyperpolarized molecule provides contrast to highlight specific areas, such as vascular imaging. This is also the case when a specific molecule generated from the hyperpolarized molecule is of interest, as in the imaging of plaques where the bound molecule is the interesting species or in cases where the information of interest is the changing concentration or distribution of a particular metabolite. In cases of metabolite mapping where more than one of the daughter molecules of the hyperpolarized species is of inter-

## G01R33/5605

According to another embodiment of the present invention, a method of performing indirect detection of a first site by transferring polarization from the first site to a second site for multiple measurements of the first site is provided. The method includes determining a scalar coupling coefficient for the polarization transfer from the first site to the second site. The first site is characterized by a first polarization. The method also includes defining a set of polarization division parameters, computing timing and phase parameters using the set of polarization division parameters, providing a pulse sequence based on the timing and phase parameters, and exposing a sample including the first site and the second site to the pulse sequence. The method further includes transferring a portion of the first polarization to a second polarization, measuring a precessing magnetization of the second site, determining a state of the first site, and repeating transferring and measuring for subsequent portions of the first polarization.

## G01R 33/4608 G01R33/5605

17. A method of performing magnetic resonance with a single magnetic resonance scan sequence, the method comprising:

- (a) providing, on a first site, a first nucleus having a spin order of a first type;
- (b) transferring a fractional portion of the spin order of the first type to a second site with a desired transfer efficiency by exposing a sample including the first site and a second site to a magnetic field provided by a magnetic resonance system, wherein the second site includes a second nucleus having a spin order of a second type orthogonal to the spin order of the first type, and wherein timing and phase parameters of the magnetic field are determined by a processor in order to achieve the desired transfer efficiency;
- (c) observing the spin order of the second type on the second site using a magnetic detector, the observed spin order of the second type indicating the transferred fractional portion of the spin order of the first type; and
- (d) repeating (b) and (c) a predetermined number of times, with the desired transfer efficiency of each repetition being variable, in order to transfer additional fractional portions of the spin order of the first type within the single magnetic resonance scan sequence.

18. The method of claim 17 wherein the spin order of the first type comprises a nuclear spin polarization.

(57) **ABSTRACT**  
 A molding process for creating a decorative pull has two separate molding steps. In the first molding step, a first top mold portion, and a bottom mold portion are used. The bottom mold portion has a mold compartment with an indentation in the bottom. An end of a soft string is placed in this compartment with the end disposed over the indentation. The first top mold portion is closed over the bottom mold portion and molding material is injected. The molding material enters the mold cavity and flows into the indentation to cover the ends of the string entirely, to create a first molded component. A second top mold portion is then placed over the bottom mold portion and molding material is then injected into the second mold cavity formed by the second top mold portion to cover the first molded component and create a molded pull for use on zippers or other items.

# Identifying Inventive concept: in Claims

1. A method for molding a decorative zipper pull, comprising:

providing a first top mold portion and a bottom mold portion, the first top and bottom mold portions forming a first mold cavity, wherein the bottom mold portion has two side walls, an end wall and an indentation adjacent the end wall;

placing at least one end of a string in the first mold cavity, such that said at least one end is disposed directly above the indentation;

closing first top mold portion over the bottom mold portion;

injecting molding material into the first mold cavity such that the molding material enters the first mold cavity and flows into the indentation to cover the at least one end of the string entirely, to create a first molded component;

removing the first top mold portion;

placing a second top mold portion having a second mold cavity over the bottom mold portion;

injecting molding material into the second mold cavity to create a molded pull; and

removing the molded pull from the mold portions.

8. A molding assembly for molding a decorative pull, comprising:

a first top mold portion,

a bottom mold portion, with a mold cavity being formed by the top and bottom mold portions when the first top mold portion is closed over the bottom mold portion, wherein a bottom surface of the bottom mold portion has side walls and an end wall forming a compartment for receiving ends of a string, and wherein said bottom surface adjacent the end wall has an indentation,

wherein when a string is placed in the compartment with the ends of the string positioned above the indentation, and molding material is injected into the mold cavity, the molding material flows into the indentation around the string and entirely covers the ends of the string, and

a second top mold portion having a second mold cavity, said second top mold portion being configured such that a molded article formed by the first top mold portion and the bottom portion be molded in a second step by replac-

# Identifying Inventive concept: in Drawings

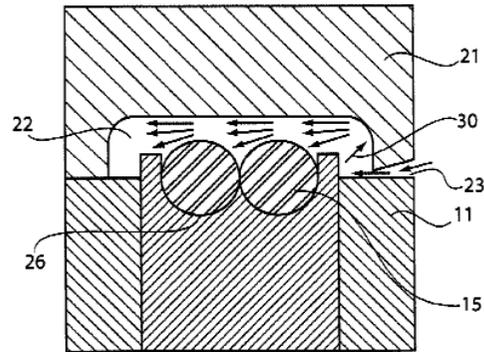

FIG. 4

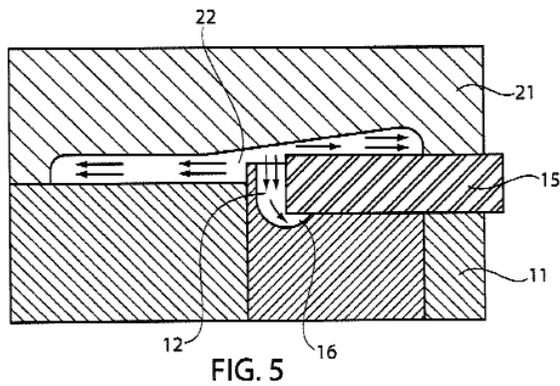

FIG. 5

# Identifying Inventive concept: in Summary of Invention

[0006] It would be desirable to provide an improved and simplified method for molding a pull, in which the string is prevented from moving during the molding process and in which the string is securely molded within the molding material.

[0007] These and other objects are accomplished by a molding process using two separate molding steps. In the first molding step, a first top mold portion and a bottom mold portion are used. The first top and the bottom mold portions form a first mold cavity. The bottom mold portion has two side walls, an end wall and an indentation adjacent the end wall. The side walls and end wall form a compartment in the mold. At least one end of a soft string is placed in this compartment with the end or ends disposed on top of the indentation. Preferably, the string is placed so that the end of the string extends over the indentation by a length that is equal to the diameter of the string. The indentation can be molded based on the type of string, so that the length of the indentation is preferably two times the diameter of the string. This way, the string extends exactly half-way into the length of the indentation.

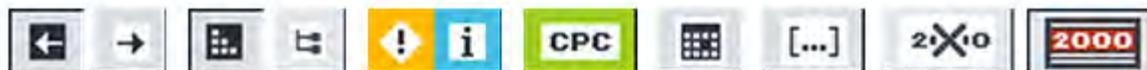

[0008] The first top mold portion is then closed over the bottom mold portion and molding material is injected into the first mold cavity. During this molding process, the molding material enters the first mold cavity and flows into the indentation to cover the ends of the string entirely, to create a first molded component. The first top mold portion is then removed and a second top mold portion is placed over the bottom mold portion. The second top mold portion has a second mold cavity that surrounds the first molded component. Molding material is then injected into the second mold cavity in a second molding step to create a finished molded pull. In a final step, second top mold portion is removed and the molded pull is removed from the bottom mold portion. The molding material in the two molding steps can be the same material, or two different materials. The molding material can be any suitable plastic material, and can be opaque, translucent or transparent. With translucent and transparent pulls, securing of the string is of high importance, so that the ends of the string remain exactly in a designated position, which is normally in the center of the mold during molding.

Special rules of classification within this group

In this class it is highly desirable to identify all aspects related to insert moulding by allocating the appropriate classification as provided for in B29C 45/14 and subgroups at additional information level.

The definition of this classification provides special rule for considering B29C45/14 at additional information level

# **FUNCTION -ORIENTED AND APPLICATION-ORIENTED PLACES**

# Function and Application-Oriented Places

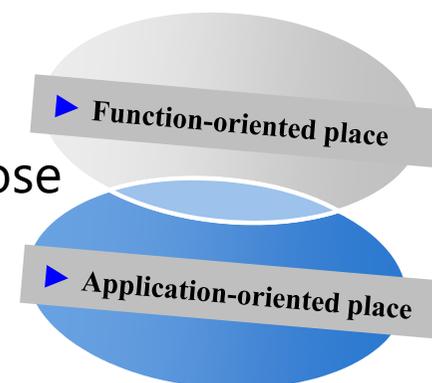

▶ CPC distinguishes between two fundamental categories of technical subjects:

- Things “per se”, “in general”, i.e. characterized by their intrinsic nature or function, i.e. **independent of its field of use**

▶ **Function-oriented place**

- Things specially adapted for particular use or purpose

▶ **Application-oriented place**

**Note:** In **function-oriented places** one often finds **limiting references** to application places containing standard wording “specially adapted for”

# Function Application places: Example

**F16F** SPRINGS; SHOCK-ABSORBERS; MEANS FOR DAMPING VIBRATION

## NOTE

This subclass covers:

- springs, shock-absorbers or vibration-dampers;
- their arrangement in, or adaptation for, particular apparatus if not provided for in the subclasses covering said apparatus.

This subclass does not cover inventions concerning the arrangement or adaptation of springs, shock-absorbers or vibration-dampers in, or for, particular apparatus, if provided for in the subclasses concerning the said apparatus, e.g.

A47C 23/00 to A47C 27/00 Spring mattresses  
{ A61F 2/00 Prostheses }  
A63C 5/075 Vibration dampers in skis  
B60G Vehicle suspensions  
B60R 19/24 Mounting of bumpers on vehicles  
B61F Rail vehicle suspensions  
B61G 11/00 Buffers for railway or tramway vehicles  
B62D 21/15 Vehicle chassis frames having impact absorbing means

▶ Function-oriented place

▶ Application-oriented place

# Where to Search First?

## ▶ Function-oriented place

Is the technical subject of the invention a spring?

Spring

BOTH

## ▶ Application-oriented place

Is the technical subject a special adaptation of a spring for use in a spring mattress?

Spring mattress

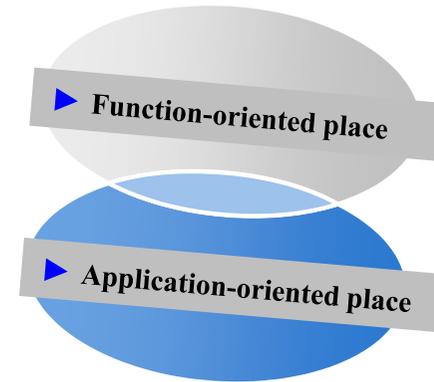

Do the essential technical characteristics of the subject relate to **both** the intrinsic nature or function of a spring **and** to adapting springs for use in a spring mattress?

# Identify most relevant places

## USE CPC scheme features

- **Notes**
- **Warnings**
- Definition is [Hyperlinked](#)
- References ([pointers to other places](#))

Function vs. Application  
Apparatus vs Process  
Process vs. Product

# Are classifications in image and text always the same?

- No, the following actions cause the CPC classification picture to change
  - Classification of another family member in another CPC group
  - Project document reclassification activities
  - Ad hoc reclassification by Patent Office personal

(57) **ABSTRACT**  
An instrument cluster for the instrument panel of a motor vehicle has at least one display on which relevant operational data of the vehicle can be displayed. The at least one display is freely programmable with respect to the data displayed on it and can be switched between at least two different configurations.
