

H01P

WAVEGUIDES; RESONATORS, LINES, OR OTHER DEVICES OF THE WAVEGUIDE TYPE (operating at optical frequencies [G02B](#))

Definition statement

This place covers:

Passive devices which have electrical dimensions comparable with the working wavelength, and which operate at frequencies up to but not including optical frequencies, e.g. microwave, and their manufacture.

Auxiliary devices of waveguide type such as filters, phase shifters, non-reciprocal devices, polarisation rotators.

Tubular waveguides and transmission lines such as strip lines, microstrips, coaxial lines, dielectric waveguides.

Devices for coupling between waveguides, transmission lines or waveguide type devices.

Resonators of the waveguide type.

Delay lines of the waveguide type.

Apparatus or processes specially adapted for manufacturing waveguides, transmission lines, or waveguide type devices.

Relationships with other classification places

Waveguides and waveguide type devices are commonly associated with antennas and aerials, these are classified in [H01Q](#).

[H01P](#) is concerned with individual circuit components, or basic combinations of them. More complicated networks with lumped impedance elements are classified in [H03H](#).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Auxiliary devices	Devices which perform an operation other than the mere simple transmission of energy.
Waveguide type	As applied to transmission lines, this term includes only high-frequency coaxial cables or Lecher lines, and as applied to resonators, delay lines, or other devices, this term includes all devices having distributed inductance and capacitance.

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

Non-reciprocal devices	Components such as circulators or isolators, using the propagation properties of ferrites.
------------------------	--

H01P 1/00

Auxiliary devices (coupling devices of the waveguide type [H01P 5/00](#))

Definition statement

This place covers:

Devices which perform an operation other than the mere simple transmission of energy.

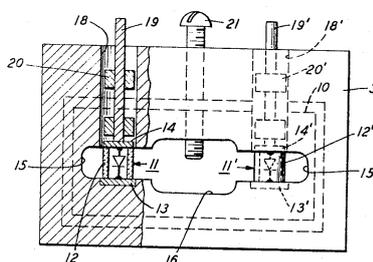

H01P 1/005

{Diode mounting means}

Definition statement

This place covers:

Any kind of transmission line provided with diodes, where the use of the diodes will change the transmission line behaviour.

- [H01H 59/00](#) (MEM's).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

MEM	Microelectromechanical (switches)
BAW	Bulk Acoustic Wave

H01P 1/11

by ferromagnetic devices

Definition statement

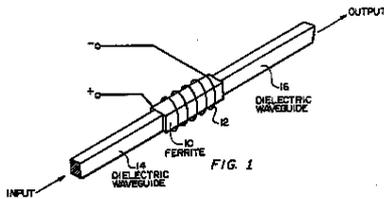

This place covers:

Anisotropic media: Media where the vectors E and D are nonparallel and/or nonparallel H and B vectors, which means that the media has different electrical properties in different directions, and thus the permittivity and/or permeability has a matrix form.

Ferrites are ferromagnetic ceramic materials, compounds of iron, boron and barium or strontium or molybdenum. Ferrites have a high magnetic permeability, which allows them to store stronger magnetic fields than iron, and are known as ceramic magnets.

Definition statement

Applying a DC magnetic bias field to a ferrite will produce that a microwave signal will propagate differently in different directions, this effect can be utilized to fabricate directional devices as isolators, circulators and gyrators. The interaction with an applied microwave signal can be controlled by adjusting the strength of the bias field, which leads to a variety of control devices such as phase shifters, switches and tunable resonators and filters.

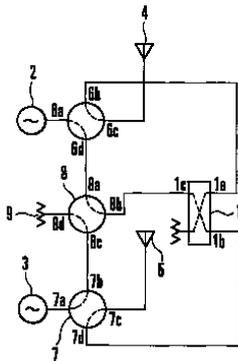

H01P 1/12

by mechanical chopper

Definition statement

This place covers:

Mechanical switches (can be electrically or magnetically controlled); redundancy switches; distribution of signals; channel selection; also mechanical aspects of switchable attenuators, filters, etc.; choking aspects.

Relationships with other classification places

MEMS in [H01H 1/0036](#), [H01H 59/0009](#).

H01P 1/175

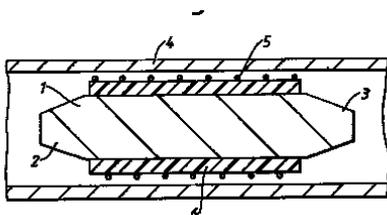

using Faraday rotators

Definition statement

This place covers:

Faraday rotation is the rotation of the plane of polarization of microwave energy exhibited when the energy is transmitted through ferrite material in the direction of a magnetic field.

A ferrite rod is included within the waveguide and is usually surrounded by an electrical coil to provide a magnetic field. By adjusting the plane of polarisation of the microwave radiation, its propagation along the waveguide may be controlled.

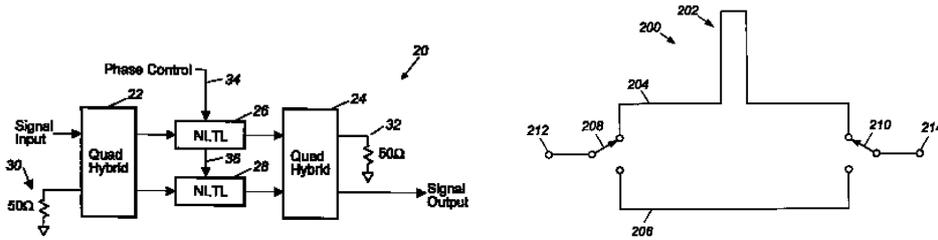

H01P 1/18

Phase-shifters ([H01P 1/165](#) takes precedence)

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "Bandpass" and "band-pass"
- "Low-pass" and "lowpass"

- "Band-stop or bandstop", "band reject", "notch filter" and "band elimination"
- "High-pass" and "highpass filter"

H01P 1/2002

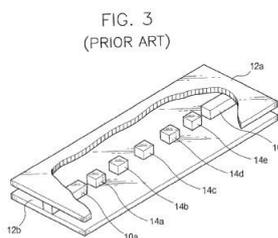

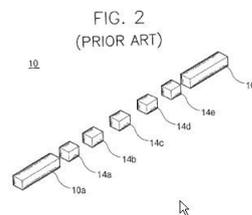

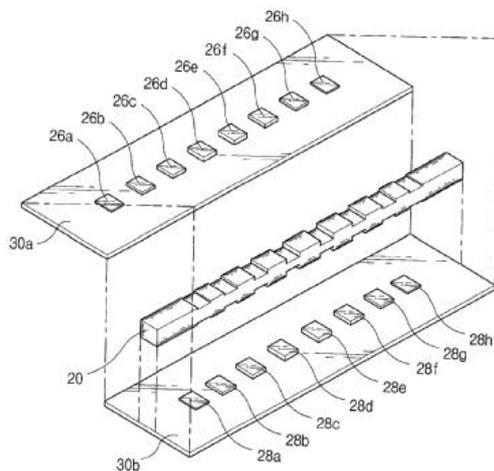

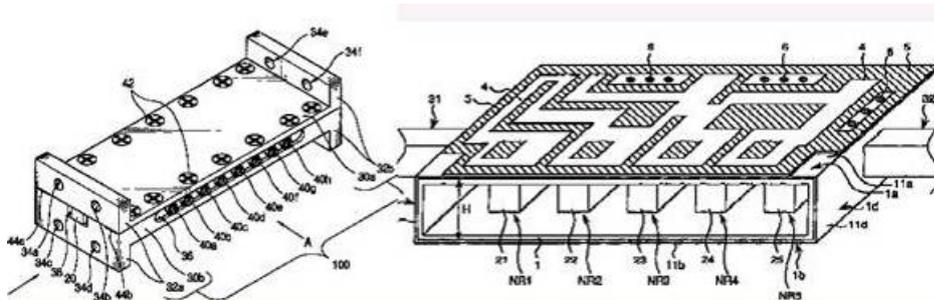

{Dielectric waveguide filters ([H01P 1/212](#), [H01P 1/213](#), [H01P 1/215](#), [H01P 1/219](#) take precedence)}

Definition statement

This place covers:

Filters implemented in a dielectric waveguide, e.g. NRD nonradiative dielectric waveguide.

The NRD guide circuit (Non-radiative dielectric waveguide) has a structure with a dielectric line through which an electromagnetic wave is transmitted and it is sandwiched between two parallel conductive plates made from conductive metal. A space of the two parallel plates is less than half a free space wavelength of a using frequency. Accordingly, the electromagnetic wave is blocked in plates other than the dielectric line and its radiation is restricted, so that the NPD guide circuit can transmit the electromagnetic wave along the dielectric line at a small loss.

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

NRD	Non-Radiative Dielectric
-----	--------------------------

H01P 1/2005

{Electromagnetic photonic bandgaps [EPB], or photonic bandgaps [PBG]}

Definition statement

This place covers:

A structure that possesses a dispersion relation having a bandgap in which propagation of electromagnetic waves is prohibited in a specified frequency band is called an electromagnetic bandgap structure.

A photonic bandgap structure is a periodic arrangement of "defects" (e.g., pits or holes formed in layer of a device) that prevents the propagation of all electromagnetic waves within a particular frequency band. The defects introduce electrical frequency stop-bands much like a Bragg grating or crystal lattice structure introduces stop-bands in an optical transmission system. The spacing of the photonic bandgap structure's periodic defects determines the stop-band frequencies.

An electromagnetic bandgap* structure (EBG) is recently receiving attention as a scheme to solve some noise problems in microwave applications. This is for the purpose of blocking a signal ranging a certain frequency band by arranging the EBG having a certain structure in a printed circuit board, and the typical EBG has roughly two, namely a Mushroom type EBG(MT-EBG) and a Planar type EBG(PT-EBG).

* To have a better explanation of the electromagnetic bandgaps, see XP11037787, XP1034579

Relationships with other classification places

[H01Q 15/00](#):

This EBG structure functions as a magnetic wall that reflects incident electromagnetic waves in phase in the vicinity of the band gap frequency band. For this reason, by installing the EBG structure on the back surface of an antenna, it is possible to achieve a lower profile of the antenna while maintaining its radiation efficiency.

(Internal Note: reference is made to KW: 1500C5E included in [H01Q](#))

[H05K 1/0236](#): Frequency selective surfaces to shield the noise coming from inside the PCB.

When meta materials are included in the PCB see [H05K 1/024](#).

The metamaterial is an artificial substance having an electromagnetic or optical characteristic which is not provided in substances existing in the natural world. Representative characteristics of such a metamaterial include negative magnetic permeability ($[\mu] < 0$), negative dielectric constant ([element of] < 0), or negative refractive index (in a case where both of the magnetic permeability and the dielectric constant are negative).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

EBG	Electromagnetic Bandgap
PBG	Photonic Bandgaps

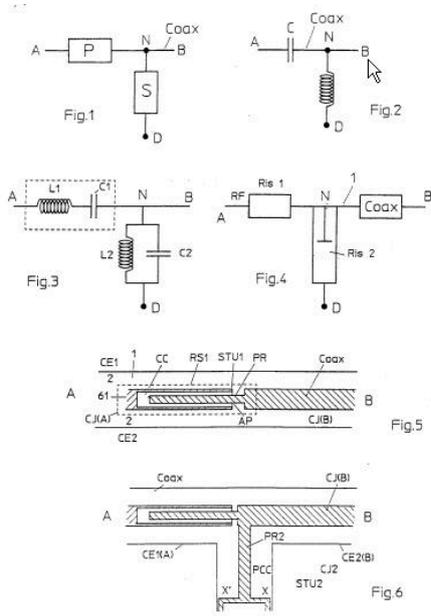

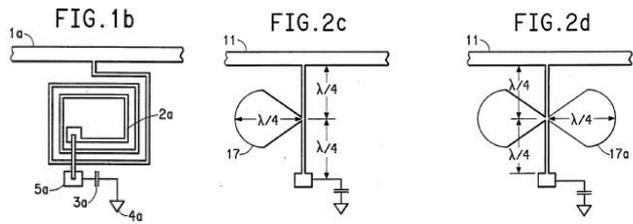

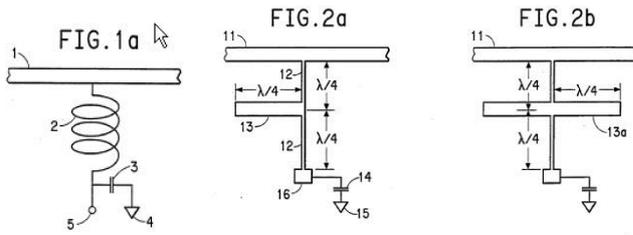

H01P 1/2007

{Filtering devices for biasing networks or DC returns}

Definition statement

This place covers:

The filtering devices including lumped elements, or striplines or coaxial implementations.

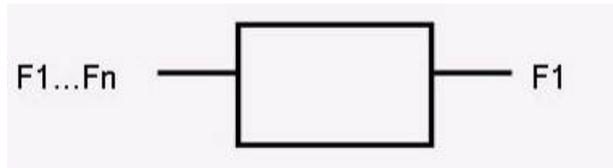

H01P 1/201

Filters for transverse electromagnetic waves ([H01P 1/212](#), [H01P 1/213](#), [H01P 1/215](#), [H01P 1/219](#) take precedence)

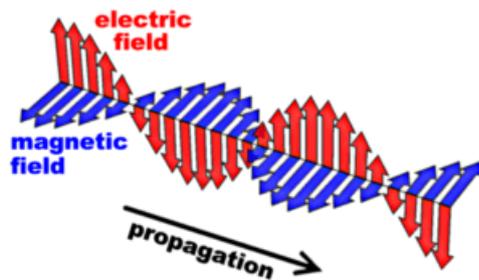

Definition statement

This place covers:

One input and one output frequency (filtered).

The basic transverse electromagnetic wave involves both a varying electric field and a varying magnetic field, appearing at right angles to each other and to the direction of travel of the wave.

combining or separating two or more different frequencies ([H01P 1/215](#) takes precedence)

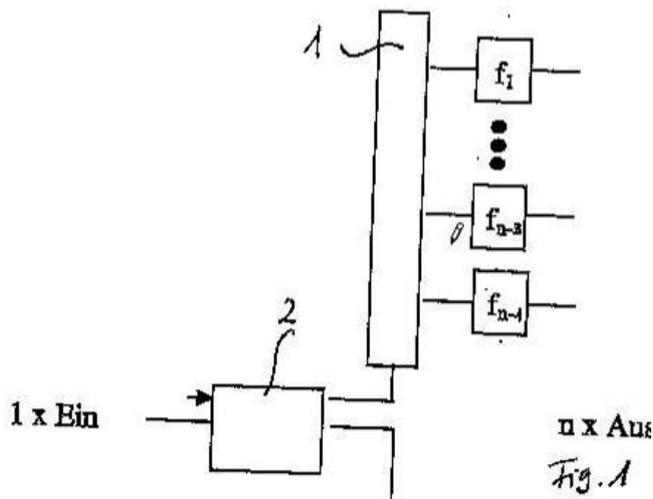

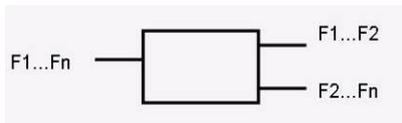

Definition statement

This place covers:

One input frequency is divided in several output frequencies (2 or more)

A multiplexer is a network that separates signals from a common port to other ports, sorted according to their frequency. A diplexer is a pair of filters arranged in a three port network, such that a signal at port one will be delivered to port 2 if it is a certain frequency band, and delivered to port 3 if it is in another frequency band.

Duplexer is the term used in radar for the element which separates transmitter and receiver (Section 1.3 Skolnik). However, in the patent literature both terms (diplexer and duplexer) are sometimes confused.

Definition statement

This place covers:

Dielectric resonators are also herein included.

i.4

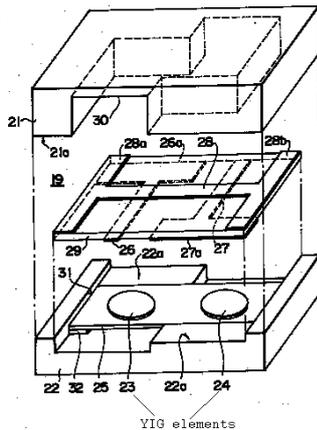

H01P 1/218

the ferromagnetic material acting as a frequency selective coupling element, e.g. YIG-filters

Definition statement

This place covers:

Single crystal yttrium iron garnet (YIG) or gallium-substituted YIG (GaYIG) are magnetic insulators which resonate at a microwave frequency when magnetized by a suitable direct magnetic field.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

YIG	Yttrium Iron Garnett
-----	----------------------

H01P 1/219

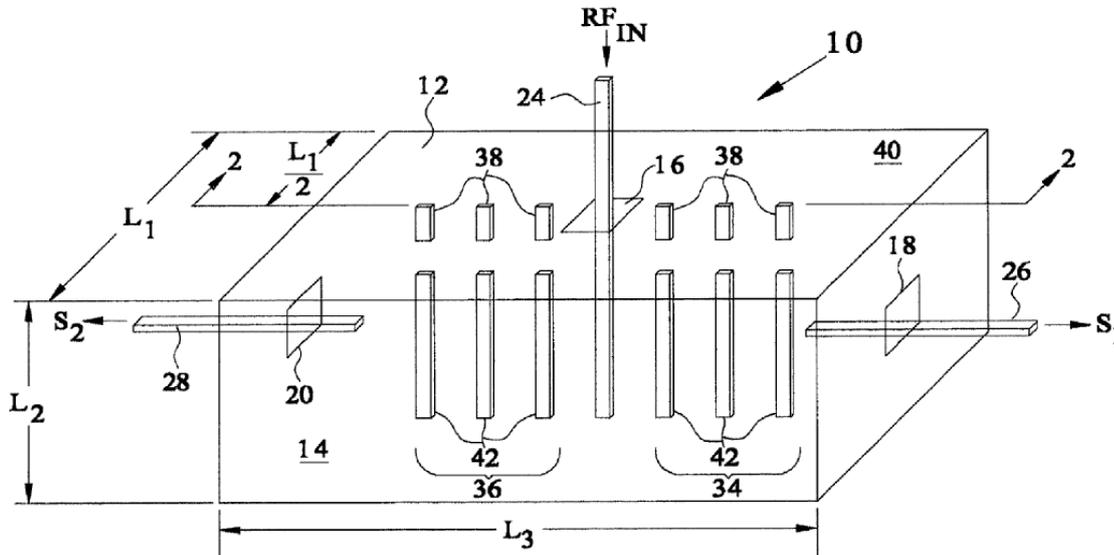

Evanescent mode filters

Definition statement

This place covers:

An evanescent mode waveguide may have a conducting tube having an arbitrary cross-sectional shape and having at least one resonator. The dimensions of the cross-section are chosen to allow wave propagation at the operating frequency of interest while causing other frequencies to rapidly decay. A sectional length of an evanescent mode waveguide can be represented as a pi or tee section of inductors whose values are functions of section length, dielectric constant, and guide cross section. A resonant post may be inserted in such a way that it penetrates the broad wall of the evanescent mode waveguide, thereby forming a shunt capacitive element between opposite conducting walls of the guide. The resulting combination of shunt inductance and shunt capacitance forms a resonance.

Evanescent resonators are typically constructed from lengths of below-cutoff (e.g. dispersive) transmission line with the resonators formed by posts, capacitive screws, ridges.

H01P 1/22

Attenuating devices (dissipative terminating devices [H01P 1/26](#))

Definition statement

This place covers:

An attenuator is an electronic device that reduces the amplitude or power of a signal without appreciably distorting its waveform.

Isolators

Definition statement

This place covers:

An RF isolator is a two-port passive device made of magnets and ferrite material which is used to protect other RF components from excessive signal reflection.

Usually, one of the ports of the isolator is grounded.

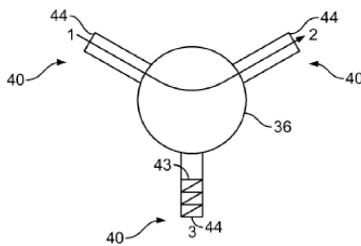

FIG. 2

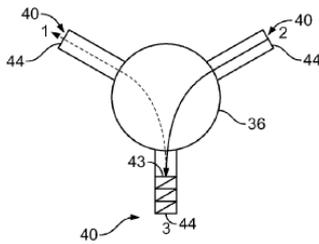

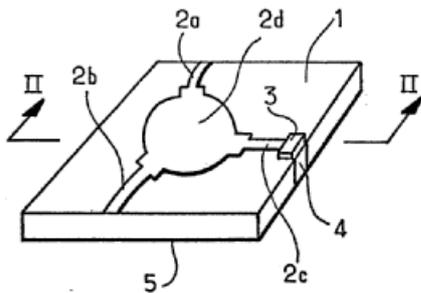

FIG. 3

H01P 1/362

{Edge-guided mode devices}

Definition statement

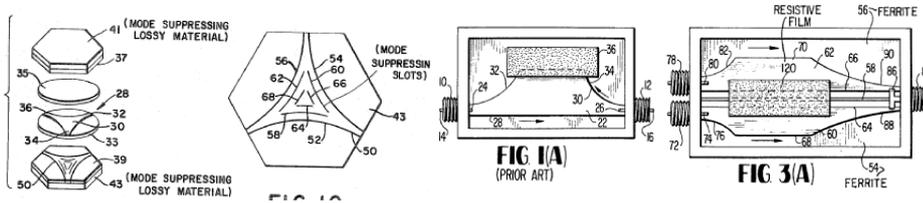

This place covers:

An edge-guided mode device is provided with a dominant mode that resembles TEM energy propagation except that there is a strong transverse field displacement causing the wave energy to be concentrated along the edges of a metal stripline conductor formed on the surface of a ferrite substrate located on a metal ground plane and having a magnetic field applied thereto perpendicular to the ground plane. The edges are designed to be free of abrupt changes in order that there be

Definition statement

no abrupt impedance change of the circuit. Non-reciprocal behaviour is obtained by asymmetrically loading the edges.

See documents US3,617,951 and US3,555,459

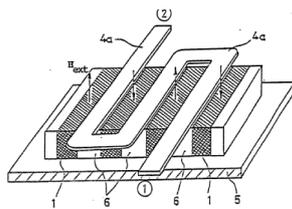

H01P 1/365

Resonance absorption isolators

Definition statement

This place covers:

In this class of isolator, an absorption element (dummy load, dielectric member, ferrite slab, etc...) could be coupled to the isolator in order to absorb the energy of a microwave propagating backwardly.

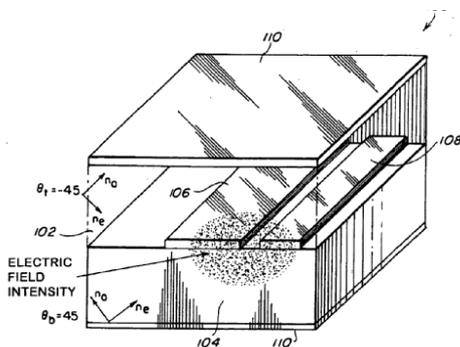

H01P 1/37

Field displacement isolators

Definition statement

This place covers:

The use of a lossy element in the isolator will produce a change in the field distribution over the conductor (microstrip or transmission line) of the isolator (see figure).

H01P 1/38

Circulators

Definition statement

This place covers:

Ferrite circulators are typically configured as multi-port (e.g., three-port) passive RF or microwave devices having within a housing magnets and ferrite material that may be used to control the direction of signal flow in, for example, an RF circuit or a microwave circuit. For example, ferrite circulators may be used to control signal flow in wireless base station or power amplifier applications. Ferrite isolators (see [H01P 1/36](#)) also may be constructed by terminating one port of a ferrite circulator. Terminating one port results in signal or energy flow in only one direction, which may be used, for example, for isolating components in a chain of interconnected components.

For more general information about circulators/isolators: <http://www.tscm.com/circulat.pdf>

H01P 1/383

Junction circulators, e.g. Y-circulators

Definition statement

This place covers:

Usually, a 3-port circulator is generally called a Y-junction circulator. In case of specification of the circulator, see [H01P 1/387](#) (stripline circulators) or [H01P 1/39](#) (waveguide circulators).

using Faraday rotators

Definition statement

This place covers:

The Faraday effect is produced when the plane of polarization of incident energy is rotated by passing the energy through an axially oriented, unidirectional, bias magnetic field. This principle is combined with well-known wave-guide principles in determining the propagation paths of electromagnetic energy in the coupler.

H01P 3/00

Waveguides; Transmission lines of the waveguide type

Definition statement

This place covers:

"Waveguide" as applied to transmission lines includes only high-frequency coaxial cables or Lecher lines, and as applied to resonators, delay lines, or other devices includes all devices having distributed inductance and capacitance.

H01P 3/003

{Coplanar lines}

Definition statement

This place covers:

A coplanar waveguide consists of a strip of thin metallic film on the surface of a dielectric slab with two ground electrodes running adjacent and parallel to the strip.

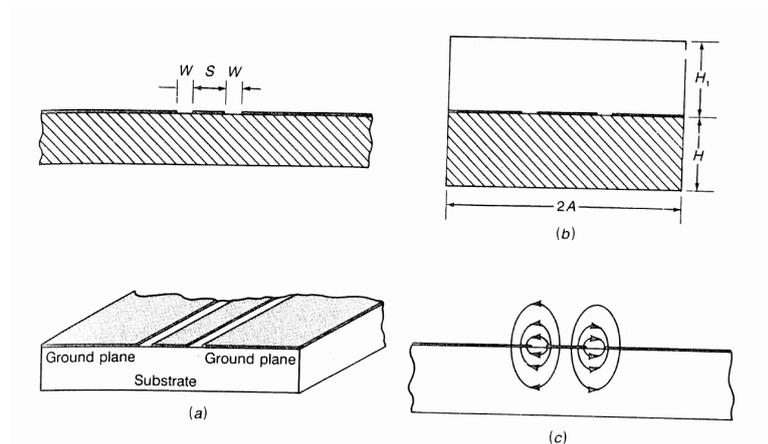

FIGURE 3.35
(a) Basic coplanar transmission line; (b) a shielded coplanar transmission line; (c) electric field distribution.

H01P 3/026

{Coplanar striplines [CPS]}

Definition statement

This place covers:

The difference between a coplanar stripline and a coplanar line/waveguide is that the coplanar stripline has, at least 2, strip line conductors provided on a substrate and without ground electrodes between them.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

CPS	Coplanar Stripline
-----	--------------------

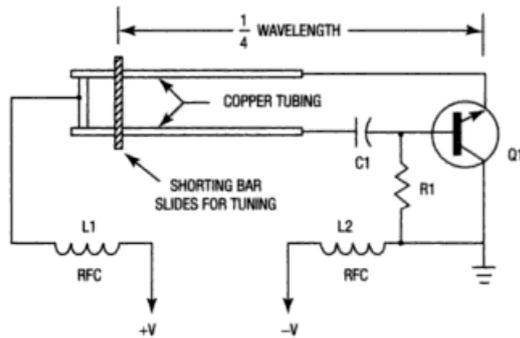

H01P 3/04

Lines formed as Lecher wire pairs

Definition statement

This place covers:

Basically, a high frequency transmission line comprising parallel wires.

Lecher oscillator.

Lecher wire—1. A type of transmission line used to measure wavelength, consisting of a pair of wires whose electrical length is adjustable. If a source of radio frequency is coupled to one end of the line and the line is adjusted until a set of standing waves is formed, the wavelength may be determined by measurement of the distance between adjacent nodes. 2. Two parallel wires with a movable shunt that are connected to the output of a radio-frequency source and are used mainly to measure wavelengths shorter than about 10 meters.

H01P 3/06

Coaxial lines

Special rules of classification

Coaxial cable are herein "usually" classified when the resonance frequency is a microwave resonance frequency (above 500 MHz) or there are modes (TEM) involved in the transmission of signals.

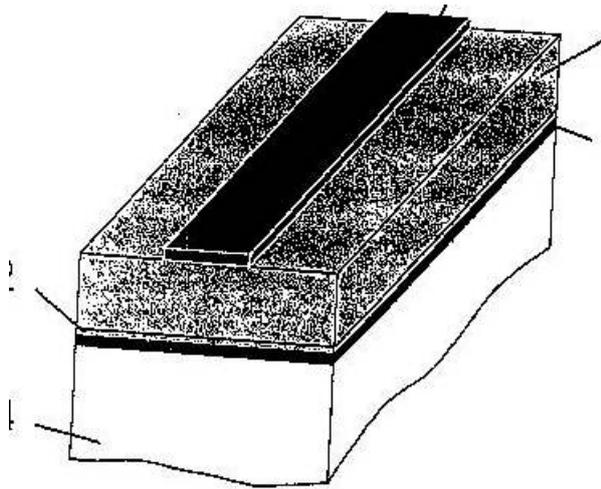

H01P 3/08

Microstrips; Strip lines

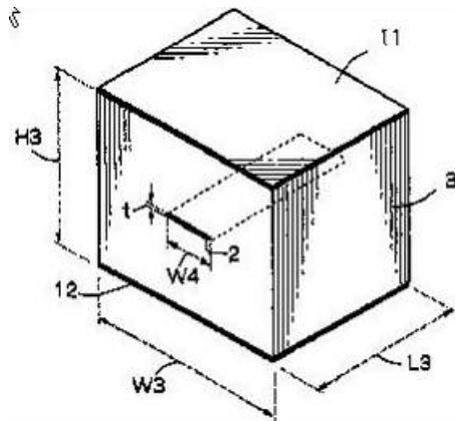

Definition statement

This place covers:

Microstrip: A conductor of width W is printed on a thin, grounded dielectric substrate of thickness d and relative permittivity ϵ .

Stripline: A thin conducting strip of width W is centered between two wide conducting ground planes of separation b , and the entire region between the ground planes is filled with a dielectric.

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "microstrip", "stripline", "strip line", "suspended line", "differential line" and "quasi-coaxial line"

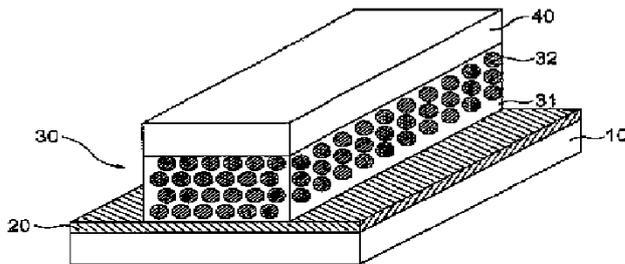

H01P 3/082

{Multilayer dielectric}

Definition statement

This place covers:

Microstrip line with a plurality of dielectric layers between the conductor line and the ground electrode.

H01P 3/084

{Suspended microstriplines}

Definition statement

This place covers:

A transmission line circuit is provided in which a layer of material is deposited on a conductive plane. Channels are formed (e.g., by etching) in material such that conductive plane is exposed. Signal traces are formed on a substrate (e.g., by etching the desired pattern in a copper sheet bonded to the substrate) which is then bonded to material such that traces are aligned with channels.

" Trapped mode"	the mode caused by reflections of wave energy between conductive discontinuities in the waveguide on opposite sides of a window member that join two different waveguides.
"Ghost modes"	Modes associated with resonant modes in the dielectric window itself (see US3594667, column 3, lines 8-26)

H01P 3/16

Dielectric waveguides, i.e. without a longitudinal conductor

Definition statement

This place covers:

Proposed by Yoneyama and Nishida in 1981, non-radiative (NRD) guide circuit is nowadays a well-known technology for millimeter-wave applications. Its basic component, the NRD waveguide, consists of a rectangular section dielectric rod (height α , width $2w$, permittivity ϵ_r), sandwiched between conducting plates that are at a distance apart less than half the free space wavelength λ_0 : thus, all discontinuities that maintain appropriate symmetry become purely reactive, with the advantage of a strong reduction in interference and radiation problems in integrated circuits. The same waveguiding structure, but with a larger space between the plates, was already proposed in 1953 by Tischer with a view to obtaining an ultra-low-loss waveguide, known as H guide. In this situation the non radiation condition $\alpha < \lambda_0/2$ is no longer maintained and the structure suffers the drawback of undesirable radiation effects from discontinuities.

Wilkinson power divider	N-way power divider that splits the input power into output power at N ports and that also provides isolation between the output powers.
-------------------------	--

H01P 5/18

consisting of two coupled guides, e.g. directional couplers

Definition statement

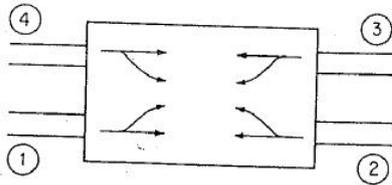

This place covers:

Directional couplers are four-port circuits where one port is isolated from the input port. All four ports are (ideally) matched, and the circuit is (ideally) lossless.

What do we mean by "directional"? A directional coupler has four ports, where one is regarded as the input, one is regarded as the "through" port (where most of the incident signal exits), one is regarded as the coupled port (where a fixed fraction of the input signal appears, usually expressed in dB), and an isolated port, which is usually terminated. If the signal is reversed so that it enter the "though" port, most of it exits the "input" port, but the coupled port is now the port that was previously regarded as the "isolated port". The coupled port is a function of which port is the incident port.

Definition statement

Looking at the generic directional coupler schematic above, if port 4 is the incident port, port 3 is the transmitted port (because it is connected with a straight line). Either port 1 or port 2 is the coupled port, and the other is the isolated port, depending on whether the coupling mode is forward or backward.

H01P 5/184

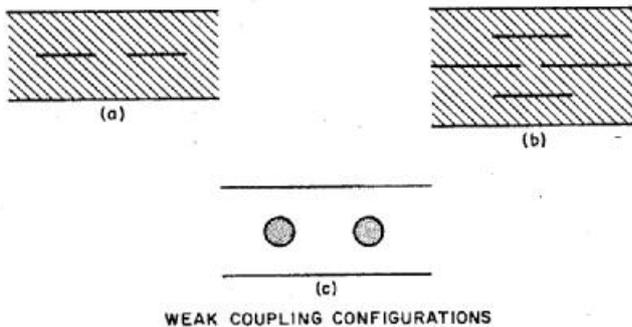

{the guides being strip lines or microstrips}

Definition statement

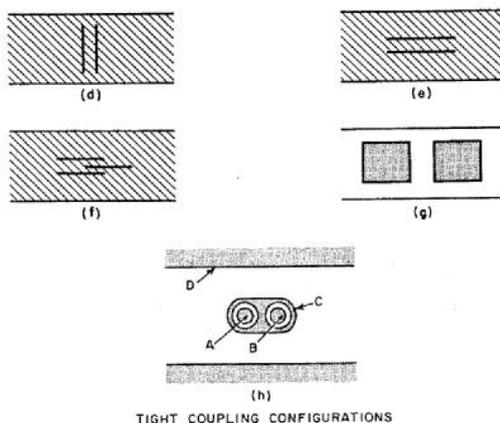

This place covers:

The couplers can be divided depending on the coupling between the lines (see following classification)

It can be a weak coupling:

or a tight coupling (coupling ≤ 3 dB)

DIELECTRIC
 CONDUCTOR

A-3597-552

H01P 5/185

{Edge coupled lines}

Definition statement

This place covers:

Weak coupling is associated with edge coupling (except Lange couplers (see [H01P 5/186](#))).

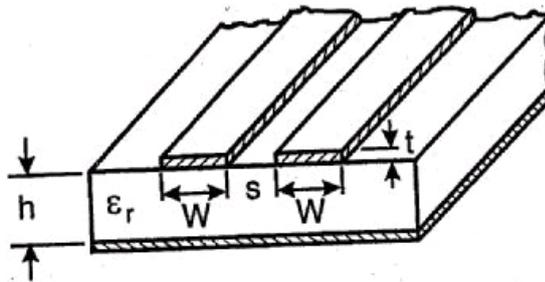

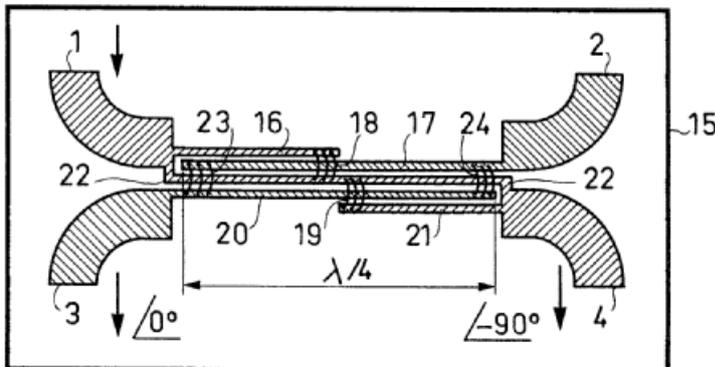

Figure 3.20 Edge-coupled microstrip lines.

H01P 5/186

{Lange couplers}

Definition statement

This place covers:

Lange couplers are generally used to couple electromagnetic energy between transmission lines. In a four port hybrid, there is an input port and a direct port, these two ports being directly and conductively connected to each other, as well as a coupled port, the latter being connected to transmission lines coupled electromagnetically (inductively and capacitively) to the conductors extending between the input and direct ports.

In a Lange type coupler, each strip conductor is divided into mutually parallel sections, and the conductor sections from the two different strip conductors are interdigitated, so that each strip section is located between two sections from the other conductor. In a planar arrangement, it is necessary to have cross-over connectors in order to establish a direct conductive connection between the various sections extending in parallel.

H01P 5/187

{Broadside coupled lines}

Definition statement

This place covers:

Tight coupling is generally associated with broadband coupling.

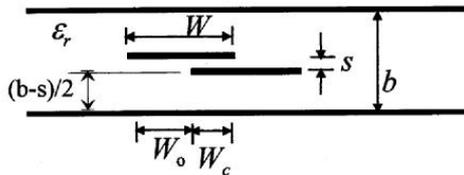

Figure 3.35 Broadside coupled off-set striplines.

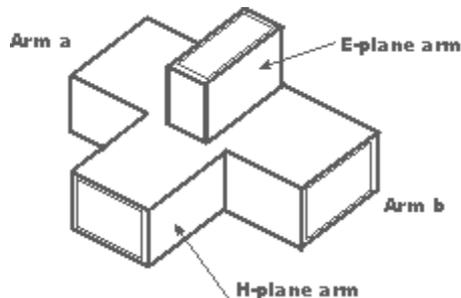

H01P 5/20

Magic-T junctions

Definition statement

This place covers:

The magic-T is a combination of the H-type and E-type T junctions.

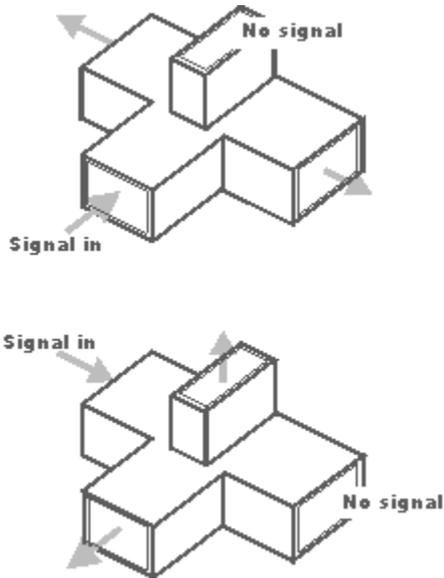

Magic T waveguide junction

The diagram above depicts a simplified version of the Magic T waveguide junction with its four ports.

To look at the operation of the Magic T waveguide junction, take the example of when a signal is applied into the "E plane" arm. It will divide into two out of phase components as it passes into the leg consisting of the "a" and "b" arms. However no signal will enter the "H plane" arm as a result of the fact that a zero potential exists there - this occurs because of the conditions needed to create the signals in the "a" and "b" arms. In this way, when a signal is applied to the H plane arm, no signal

Definition statement

appears at the "E plane" arm and the two signals appearing at the "a" and "b" arms are 180° out of phase with each other.

Magic T waveguide junction signal directions

When a signal enters the "a" or "b" arm of the magic T waveguide junction, then a signal appears at the E and H plane ports but not at the other "b" or "a" arm as shown.
